We have shewed already, that there is outwardly a difference betwixt the biting wound of the Male and the Female Viper, for after the male hath bitten, there appeareth but two holes, but after the Female hath bitten, there appeareth foure; and this is also a great deal more deadly then the biting of the male, according to the verfes of Nicander where he faith,

Ferox Viperes quad amica germine perior
Femina: que velati majores accumulat ura,
Sic venenum magis fari necia vulnura mori,

Venemata rurceus in tempe touch natura.

Which may be englified thus,

But of the Viper’s brea\w the female is the worst,
Whic\w as it were, with greater wrath doth burn (curse)
And therefore when she bites, makes bodies more ac-

Which is reported to be true, that the wounds which the female maketh by her biting, being well considered, is more deadly then the wounds which the male giveth: yet for the proportion of the poifon which the male venteth into the wound he maketh, it is more deadly then the females: so that with refepect of quantity: they both say true which affirm either the one or the other. But which sooner is the greatest, it skilleth not much, for both are deadly enough, as may appear by the common symptoms and figues which follow, and also death.

Malthus reporteth a history of a Country-man, who as he was mowing of grasse, chanced to cut a Viper clean afunder about the middel, or some what nearer the head, which being done, he stood still, and looked upon the dying di\w far parts a little while, at last, either presuming that it had no power left to hurt, or thinking it was dead, he took that part in his hand where upon the head was: the angry Viper feeling his adversaries warm hand, turned the head about, and bit his
Of the Viper.

his finger with all the rage, force, and venom that it had left, so that the blood issued out. The man thus bitten for his boldness, did hastily call it away, and began to suck the wound, putting his hand to his mouth, which when he had done but a little while, he suddenly fell down dead.

By the like story unto this, is related by Aetius Lepidus of another, which moreboldly than wise-

ly, did adventure to take a live Viper into his hand upon a wager of money, but as the other, so this paid for his rashness, for the angry Viper did bite him as did the former, and he sucked his wound as did the Country-man, and in like manner fell down dead.

As both which examples, we may well see the danger of the Vipers poison, so that if once it come into the Romack, and touch the open passage where the vitall parts goe in and out, it never stayseth long but death followeth. Wherefore Aetius faith well, that sometimes it killeth within the space of seven hours, and sometimes again within the space of three daies, and that respite of time feemeth to be the longest, if remedie be not had with more eftectual speed.

The Signes or effects of the Vipers biting, are briefly these, first there is fluxeth a rotten matter, sometimes bloudy, and sometimes like liquid or molten fatneffe, sometimes again with no colour at all, but all the flesh about the forefeeth, sometimes having a red, and sometime a pale hue or colour upon it, issuing alfo forth a corrupted matter matter. Alfo it causeth divers little blifters to arise upon the flesh as though the body were all scorched over with fire, and spee-

dily after this, followed putrefaction and death.

The pain that cometh by this Serpents wounding, is so universal, that all the body seemeth to be set on fire, many pitiful noyles are forced out of the partes throat by fene of that pain, turning and crackling of the neck, alfo twinkling and wrying of the eyes, with darkneffe and heavineffe of the head, imbecility of the loynes, sometimes thrilling intolerably, crying out upon his dry throat, and again sometimes freezing at the fingers ends, at leaft fo as he seeleth such a pain. Moreover, the body sweateing a sweate more cold then now it felleth, and many times vomiting forth the bilious tumors of his owne belly. But the colour going and coming is often changed, now like pale, then like black, and anon as green as the rufh of braffe, the guns flow with bloud, and the Lawr it felleth to be infamous, deepneffe and trembling pooffelth the body and feve-

ral parts, and difficulty of making urine, with Feavers, fneezing and shortneffe of breath.

These are related by Aetius, Agicina, Grevium and others, which work not alwayes in every body generally, but some in one, and some in another, as the humours and temperament of nature doth lead, and guide their operation. But I marvel from whence Plato in his Sympoium had that opinion, that a man bitten and poisoned by a Viper, will eli it to none, but onely to those that have formerly suffered of that miserie : for although among other effects of this poison, it is said that madness, or a distracted mind alfo followeth, yet I think in nature there can be no reason given of Platos opinion, except he mean that the patient will-never manifeit his grief at all. And this howsoever alfo is confuted by this one story of Grevium. There was (as he writeth) a certain Apothecary which did keep Vipers, and it happened one day as he was medling about them, that one of them caughthim by his finger, and did bite him a little, so as the prints of his teeth appeared as the points of needles. The Apothecary onely looked on it, and being busied, either forget, or (as he said after ward) felt no pain for an hours space : but after the hour, firft his finger smarrted and began to burn, and afterward his arm and whole body fell to be suddenly distempered therewith, so as neceffity contrayning him, and opportunity offering it elfe, he fent for a Phyfitian at hand, and by his good advice. (chorow Gods mercy) was recovered, but with great difficulty ; for he suffered many of the former paffions and symptomes before he was curre.

Therefore by this story, either Plato was in a wrong opinion, or else Grevium telleth a fable, which I cannot grant, because he wrote of his owne experience, known then to many in the world, who would quickly have contradicted it : or else if he had confented to the opinion of Plato, no doubt but in the relation of that matter, he would have expreffed alfo that circumftance.

Thus then we have, as briefly and plainly as we can, delivered the pains and tormentes which are cauoy by the poison of Vipers ; now therefore it followeth, that we alfo briefly declare the vertue of fuch Medicines, as we find to be applid by diligent and careful obseruations of many learned Phyfitians, against the venom of Vipers. Firft of all they write, that the general rule muft be obser-

ved in the curing of the poison of Vipers, which is already declared against other Serpents, namely, that the force of their poison be kept from spreading, and that may be done either by the preface extraction of the poison, or else by binding the wounded member hard, or else by cutting it off, if it be in finger, hand or foot.

Galen reporteth, that when he was in Alexandria, there came to the City a Countryman which had his finger bitten by a Viper, but before he came, he had bound his finger close to the palp of his hand, and then he theewed the fame to a Phyfitian, who immediately cut off his finger, and so he was curre. And besides he telleth of another country-man, who reaping of Corne, by chance with his sickle did hurt a Viper, who returned and did raze all his finger with her poisonfull teeth. The man presently conceiving his own peril, cut off his own finger with the fame sickle, before the poi-

son was spred too far, and fo was cured without any other Medicine.

Some time it hapneth that the but is in fuch a part that it cannot be cutoff, and then they apply a Hen cut in funder alive, and laid to as hot as can be, alfo one muft fift wath and anoint his mouth with oy, and fow suck the poison. Likewife the place muft be scarified, and party fed and diered with old Buter, and bathed in milk or Seawater, and be kept waking, and made to walk up and down.
The History of Serpents.

It were too long, and also needless, to express all the medicines which by natural means are prepared against the poison of Vipers, whereof seeing no reasonable man will expect that at my hands; I will merely touch two or three cures by way of history, and for others, refer my Reader to Physiades: or the Late Discourse of Caracius. In Noroberia, the country of that great and famous Gellius who translated Avicen, there is a fountain, into which if any man be put that is flung or bitten by a Serpent, he is thereof immediately cured; which Amatus Lusitanus approveth to be very natural, because the continual cold water killeth the hot poison. The fame Author writeth, that when a little maid of the age of thirteen yeares, was bitten in the heel by a Viper, the legge being first of all bound at the knee very hard, then because the maid fell distraft first he caufed a Surgeon to make two or three deeper holes then the Viper had made, that fo the poison might be the more easily extracted, then he scarified the place, and drewd it with cupping-glasses, whereby was exhausted all the black blood, and then also the whole leg over, was scarified, and blood drawn out of it as long as it would run of it own accord. Then was a plaister made of Garlick, and the sharpest Onions rolled, which being mixed with Triacle, was laid to the bitten place. Also the maid drank three daies of Treacle in wine, and foure hours after a little broth made with Garlick.

The second day after the abatement of the pain, he gave her the juice of Yew-leaves falling, which he commendeth as the most notable Antidote in this kind, and so made a second plaister, which lay on three days more, and in the mean time the drink falling every day that juice of Yew-leaves, whereby her trembling and distraft etate was abated, but from the wounded place till flowed matter, and it looked black. Then the four next daies, the said matter was drawn out by a linnen cloth, wherein was Goates dung, powder of Lawrell, and Euphorbium in Wine, all mixed together, and afterward he made this ointment, which did perfectly cure her, Res: of long Arisfaloebiti two ounces, of Briony and Daffadil one ounce, of Galbanum and Myrrhe, of each one ounce, with a convenient quantity of oyle of Baies and Wine. This applied to the bitten place in a linnen cloth, and tentures twice a day, did perfectly recover her health within a month.

Rhus Viperis Eau ague cured himselfe, with binding his finger hard that was bitten, and applying to it Triacle dissoyled in Aque vita, and drunk up in linte or bumball: and he advieth instead of old Triacle, to take M thứdlate. Gofer faith, that he saw a maid cured of the eating of Vipers fliehs, by being constrained to drink Wine abundantly. Theophrastus and Aelopides do write, that many are cured by the sound of good Musicke, as the like is already shewed, in the cure of the poifon of the Potentium: and no marvlss, for Ipmenias the Thican affirmeth, that he knew many in Beuta, that were cured of the Sciratica, by hearing of the musical found of a good pipe.

Of the Medicines which may be made of the Viper.

The eating of Vipers is an admirable remedy against the Leprose. And being prepared after that fort as was mentioned immediately before in the former Section, they are miniftred to the sick persone sitting in the sun, yet his head must be well covered or shadowed. Neither indeed to eat Vipers alone, or twice is sufficient, but it must be done often, fith it is without danger, and moreover bringeth great commodity. And let the Vipers be new, and taken out of moist places, for those which are bred near the Sea, are very thristy and dry. The broth also of sod Vipers, is for such persones good supping meat.

The flesh of Vipers is in temperature apparently hot and dry, and purgeth the whole body by sweat; hence upon many fore tormented with Leprose, by eating and drinking them have been cured.

Avertisse faith, the flesh of Tyrreni clenfeth Leprose, because it driveth the matter thereof to the skin, and therefore they that drink it, fall first into the passion of Tyrria, that is, the pilling of the skin, and after are cured of it.

Chufe the Vipers of the Mountain, especialy being white, and cut off their heads and tails at once very speedily, and then if the issue of blood be plentiful, and they continue alive, and wallowe to and fro a long time, there be good. After their beheading, let them be made clean and sod, and let the diseased party eat of them, and by their broth.

And by the drinking of wine wherein a Viper dieth or liveth, certain have been cured accidentally, or by an intent to kill them.

The Leaper must first drink the broth of Vipers decocted, in manner as afore-faid, then let him eat the flesh, no other wise then as mutton or fowles, which daily men dine with, but falling and in the morning this flesh must be eaten, halfe a Viper at once, and sometime a whole Viper, according to the strengt of the party diseased. After the eating whereof, he must not eat or drink in the space of fix hours: but if he doe sweat, it is most expedient that in his sweat he look to himself very carefully. And the skin is worn to be off it the Leaper, as it usually befalleth Serpents.

A man may easieley see the flesh of Vipers to be hot and dry, when they are dressed as Eels. And that they purge the whole body throw the skin, thou mayst learne even by those things, which my self being a young man, had experience of in our Countrey of Asia, which thing severally and in order I shall relate.

A certain man infected with the diseafe which men call Elephas, that is, Leprose, for a time conversed still with his companions, till by his company and conversation, some of them were infected with the contagion of the diseafe, and he now became lothsome to smell, and filthy to fight. Building therefore
therefore a cottage for him near the Village, on the top of a bank, hard by a Fountain, there they place this man, and daily bring to him so much meat as was sufficient to sustain life. But at the rising of the Dog-star, when by good hap, Reapers reap'd not far from that place, very fragrant Wine was brought for them in an earthen vessel: he that brought it, set it down near the Reapers, and departed; but when the time was come that they should drink it, a young man taking up the vessel, that according to their manner having filled a boul, he might mingle the Wine with a competent measure of water, he poured the Wine into the bowl, and together with the Wine fell out a dead Viper.

Wherefore the Reapers amazed the least, and fearing lest if they drank it, they should receive some harm thereby, chose rather indeed to quench their thirst by drinking water: but when they departed thence, of necessity and in piety, gave the Wine to this Leper, supposing it to be better for him to die, than to live in that misery. Yet he when he had drunk it, in a wonderful manner was restored to his health: for all the scurf of his skin fell off as the flakes of tender shelled creatures, and that which remained, appeared very tender, as the skin of Crabs or Loculce, when their outward shell is taken away.

Another example by a chance not much unlike, hapned in Myia, a Countrey of Asia, not far from our City. A certain Leper went to wash himself in Spring-water, hoping thereby to receive some benefit. He had a maid-servant, a very fair young woman, importuned by divers luters: to her the sick man committed both certain other things pertaining to the house, and also the store-house. When they therefore were gone into the room, to which a filthy place and full of Vipers adjoining, by chance one of them fell into a Vessel of Wine there negligently left, and was drowned. The Maid effecting that a benefit which Fortune offered, filled that Wine to her Master, and he drank it, and thereby in like fort as he that lived in the Cottage, was cured.

There are two examples of experiment by casual occasion. Moreover, I will add also a third, which proceeded from our imitation. When one was sick of this disease, in mine more than the common fort Philosophical, and despising death, took it exceeding grievously, and said it were better once to suffer death, then to live so miserable a life: and drinking Wine so mingled with popion, he became a Leper: and afterward we cured his Leprosie by our acclimated medicines.

Also a fourth man took Vipers alive, but that man had only the beginning of this disease; therefore our care and industry was very speedily to restore him to health: wherefore having let him bloud, and by a medicine taken away melancholy, we had him use the Vipers he had taken, being prepared in a pot after the manner of Eels. And he was thus cured, the infection evaporating through the skin.

Lastly also, a certain other man very rich, not our Country-man, but of the middle of Thracia, admonished by a dream, came to Pergamum, where God commanded him by a dream, that he should daily drink the medicine which was made of Vipers, and outwardly he should anoint his body, and not many days after, his disease became the Leprosie: And again also, this infirmity was afterward cured by the medicines which God commanded.

Matthew Grady fed Chickens and Capons with the broth and fleth of Vipers mingled with bread, Galen, till they cast their feathers, purposing by them to cure the Leprosie.

A certain Noble-woman in this City, infected with this malady (the Leprosie) after divers infortunate attempts of many, came to my hands, in whose case, when generous medicines availed nothing, at last, with consent of her husband, I purposed to try her with Vipers' fleth: whereupon a female Viper being cleansed and prepared after that fort as Galen preferreth in his Book De Terri- statica, mingling the fleth of the Viper with Galangal, Saffron, &c. I fed her very well: then I took a Chicken, which I commanded well to be fed in the juyce and broth of the Viper. And left the should take any harm thereby, I first minified unto her Mithridate, then the Chicken with the broth, by eating whereof she faid she felt herself better: Which when I saw, I took another male Viper, whom I f lod alone without adding any other thing, and the broth thereof I minified to her three days, whereupon he began to sweat extremely, the sweat I restrained by syrup of Violets and pure water. After six days, scales fell from her, and she was healed. Moreover, the day after conceived a man-child, having been barren before the space of forty years.

Autumina Myia a Phyfician, when he met with an incurable Ulcer, he gave his patients Vipers to eat, and cured them with marvalious celerity. When the servants of Graterus the Phyfician fell into a strange and unusual disease, that his fleth fell from his bones, and that he had proved many medicines which profited him nothing, he was healed by eating a Viper dressed as a fift.

Vipers' fleth if it be sod and eaten, cleareth the eyes, helpeth the defects of the linews, and repref feth swellings.

They say that they eat Vipers become lousie, which is not so, though Galen affirm it. Some add Diocorides them to live long who eat that meat, to wit, Vipers. Iobgoma affirmeth the Creti, a kinde of Indian, to live an hundred and forty years. Also he thinketh the Ethiopiaans, and Seres, and the Inhabitants of Mount Athos to be long lived, because they eat Vipers fleth.

The Seythians cleave the head of the Viper betwixt the ears, to take out a stone, which they say Pliny. the devoureth when she is affrighted.

The heads of Vipers burnt in a pot to ashes, and after beaten together with the grooff decotion of bitter Lupines, & spred as an ointment on the temples of the head layeth the continual rheume of Z z z.
The History of Serpents.

The flow of the Viper cureth the Ring-worm. The skin of the Viper beaten to powder, and laid upon the places where the hair is fallen, it doth wonderfully restore hair again.

Some extend and dry whole Vipers, and after beat them to powder, and minifier them in drink against the Gowt. Others about the rising of the Dog-flar, cut off the head and tail of Vipers, and burn the middle, then they give those ashes to be drunk 21 days, so much at a time as may be taken up with three fingers, and so cure the swelling in the neck. Joynets paind with the Gowt, are profitably annointed with Oyl wherein a Viper hath been foded, for this cureth perfectly.

The making of the Oyl of Vipers, is described in these words: Take three or four Vipers, cut off their extram parts, the head and the tail, in length four fingers, divide the relf into four goblets, and put them in a pot open above and below, which pot must be put into another greater pot; then the mouth of them must be well flut with clay, that they breath not forth; then put them into a Caldron full of fething water, and there let them continue boiling two hours in those pots: then will diffil a liquor from the Vipers, which were in the pot open above and below, with that Oily liquor anoint the members of the party molefted with the Palfie, for by a secret property it cureth the grief of that disease.

Of Triacle and Trochuk of Vipers.

Theriaca or Triacle, not only because it cureth the venemous biting of Serpents, but also because the Serpents themselves are usually mingled in the making thereof, it is so named of both significations. Here also we will insert something concerning Trochus of Vipers, which are mingled in the making of Triacle.

Triacle is very ancient, and hath always very carefully, and not without ambition, been refined by the Physitians, till Andromachus Neso his Physitian, added the flesh of Vipers, as the full accomplishment of this drug. The flesh of Vipers alone is mingled in Triacle, and not the flesh of other Serpents, because all the reft have something malignant more then Vipers. Vipers are thought to have leffe poyfon in them then other Serpents.

Vipers for Triacle must not be taken at any time, but chiefly in the beginning of the Spring, when having left their dens, they come forth into the Sun-shine, and as yet have not poyfon much offensive.

Take female Vipers, for we must take heed how we take male Vipers for the confection of Antidotes. For Trochus all Vipers are not convenient, but thofe which be yellow, and of the yellow, the females only.

Vipers great with young you must refufe, for being pregnant, they are more exasperate then themselves at other times.

Of Vipers be made Trochus, which of the Grecians are called Theriac, four fingers being cut off at either end, and the inwards taken out, and the pale matter cleaving to the back-bone: the reft of the body must be boiled in a dish in water, with the herb Dill, the back-bone must be taken out, and fine flowre must be added. Thus these Trochus being made, they must be dried in the shade, apart from the Sun-beams, and being so prepared, they be of very great use for many medicines.

The use of Triacle is profitable for many things, for not only by his own nature it availeth against the biting of venemous creatures and poysons, but also it is found by experience, to help many other great infirmities. For it easeth the Gowt and pain in the joynets, it dryeth fluxes, it very much profiteth men molefted with the Dropifie, leprous and melancholick persons, thofe that have Quartane Agues, or the Jaundife, thofe that have a weak voice, or that spet blood: thofe that are troubled with aking reins, with Dyfentery, with the flone, with fit breath, with passion of the liver or milk, with choler, with heart-ach, with the Falling-fickneffe. It driveth all kinde of Worms out of the bowels. It is the moft sovereign remedy of the Plague.

Even to them that are in health the often use of it is wholesome, for it promifeth long life, and firm health, it consumeth excrements, it strengthenth natural actions, it quickenth the wit, and sharpeneth all the fenses; it preferveth the body from poyfon and other offences, and maketh it scarce subject to danger by such casualties; it begetteth good blood, it corrupteth the air, and waters; neither alone doth it deliver from infant diseases, but also preferveth from thofe that be imminent.
Of the Earth-worm.

Although there be many and sundry sorts of Worms which do contain in them some poiysonous quality, yet for all that, at this time my purpose is to discourse especially of Earth-worms, whereof some are bred only in the earth, and others among plants, and in the bodies of living creatures. Worms of the earth are termed by Plautus and Columella Lumbrici, peradventure as being derived a Lubriciate. They are called also Terra Intestina of the Latiners, as well because they take their first beginning and breeding in the very bowels and inward parts of the Earth, as because being pressed and squeezed between the fingers or otherwise, they do void forth excrements after the fashion of living beasts that have inwards in them. The Greeks call them Gei entera; Hesychius calleth them Embellaw; Brunfelsius Otko in his Physick Lexicon writeth, that they are usually called in the Cilicien tongue Cophagos, fetching the derivation of the word para. To gain, phe.; for they feed upon earth. Of the Englishmen they are called Media, and Earth-worms; of the French, Vert de Terre; of the Germans, Eri wurr, and Erdwurmen, Melet, Ode Regina-wurr, or Renenwurr; of the Italians, Lumbrighe; of the Spaniards, Lumbriques; of the Polonians, Gliti; of the Hungarians, Galizes; of the Arabians they are called Charatih. Manardus in his second Book and 40. Epistle writeth, that in times past they were called Onisculi, and Niscoli.

There are found especially two sorts of Earth-worms, which are either greater or lesser. The greater Earth-worms are somewhat long, almost like in proportion and shape to those round Worms which do breed in mens bodies. They are half a foot long at least, and being stretched out in length they are found to be a foot long; they are of a whitish colour, and sometimes though seldom of a bloody hue: and for the most part they are all adorned with a chain about their necks, or rather they seem to wear a certain collar, wherein there is a little blood contained, and they lack eyes and eye-lights, as all sorts of Worms do.

They breed the slime of the earth, taking their first being from putrefaction, and of the fat moisture of the same earth they are again fed and nourished, and into earth as alfe are resolved. When there falleth any thowre of rain, then this kind of Worm creepeth suddenly out of the earth, whereupon old Euclio in Plautus being very careful of his pot of Gold, speaketh aptly to his Drudge Strobilus in these words:

_Fors, furm Lumbrici, qui sub terra crepfti modo,\nSub modo nafium camparebo, nunc autem cum comparis, peri._

Which may be Englished thus:

_Away, a way thou Worm, late from the earth crept out,\nSafe thou wast unseen, but seen, life fails I doubt._

In Aulularia.

Here Euclio very properly terrneth his Bondman Strobilus, a Worm, because not being espied of his Master before, he suddenly came sneaking out from behinde an Altar where he was hid, much like a Worm, that in moist weather influxeth out of the ground. Those little heaps which are cast up and lie shining and wrinkled before the mouth or edges of their holes, I take them to be their miry excrements: for I cold never as yet finde other excremenitious substance, drothy matter, or other feculency, but only bare earth in them, whose alimentary juice and moiurne being clean exhausted, they call out the remainder, as an unprofitable burthen, nothing fit for nourishment. At the entrance of their doors, which yet readeeth them to some commodious use, for stopping and damming up their holes that the rain cannot so easily foke in, they are by these means safely defended from many annoyances and dangers, that otherwise might light upon them.

Their delight is to couple together, especially in a rainy night, cleaving together until the morning: and in the same they are not folded round about one another like unto Serpents, but are straitly closed together side-wise, and thus do they remain flacking close the one to the other. They fend forth a certain frothy fibre or jelly when that they join together. They do ever keep the middle part of their body within the earth, I mean their hinder-parts; yea even in their mutual joyning together; neither are they at any time so faint gleaved and closed, but with the leaf flitting and motion of the ground that can be imagined, they are straightly-waves severed, withdrawing themselves speedily into their lurking holes. In rainy weather they are whiter a great deal then at other times, unseelie it be when they couple together, for then they appear very red. I myself about the midft of April, did once open a thicke female Worm, and within the flesh I found a certain receptacle ringed round about, and filling up the whole cavity of the body, having a thin membrane or fin enclosing it, and in this aforesaid house-houe the earth which the had fed on, and wherewith they was sustained, was held and contained. Her egges were found to be in a safe place above the recepacle, next to the mouth, there were many of them on a heap together, being all of a whitish colour.

The leffer Earth-worms for peculiarities fake, we with Georgius Agricola will name Aforidere; and these are often found in great numbers in Dung-hills, Mixens, and under heaps of stones. Of this sort some are red, (which we Englishmen call Dugs) and these be they that Anglers and Fishers do.
The History of Serpents.

do so much desire, for Fitches will greedily devour them, and for that end they with them do bait their hooks.

There be some others of thefe leffer Earth-worms that are somewhat of a blew colour; other-fome again are yellow only about the tail: whereupon they have purchas'd the name of Yellow-tails. Some again are ringed about the necks, withall very fat. Some others there be that have neither chains nor rings, and these commonly be more lank and slender of body then the former, and these I judge to be the males. These Worms do specially breed in Autumn, or at the fall of the leaf, by reason then there is but little moisture in the earth, and this is Aristotel's opinion. Both kinds do live long in the water, but yet at length for want of suffulence there they die. They move from place to place with a kinde of reaching and thrumling forwards, for we cannot properly say that they do either rowl or tumble. Olympio in Plautus would go about to make a simple plain fellow believe that Worms did eat nothing but very earth, because he used these words to Chalinus:

Post autem nifs nifs ruri tu erumn comedies: (for thus Lambine readeth)

Ait quafi Lumbricis terram.

In English thus:

And afterward thou nought but Tares shalt eat, Or else like Worms, the earth shall be thy meat.

But by earth here in this place, he understan'deth not pure earth, and such as is without any other mixture, but rather the fat, juicy, and moisture of the fame. And this is the reason, that Earth-worms are not to be found in all soils alike, as in barren, sandy, stony, hard, and bare grounds, but only in fat, gravelly, moist, clammy and fertile. And for this respect England hath many Worms, because both Country and soil are very moist: and this moisture whereon they feed mulf not be falt, lowe; tart, or bitter, but sweet and toothsome: and therefore it is, that Lucretius in his second Book writeth, that Worms are bred moist when it showreth, as in rainy seaons and moist weather.

Quantem in pullos animales dixit ovum
Cerminius altitum, vermeus: effore terram
Intempestivos ejus putor copit ob imbres.

In English thus:

Even as in time of rain, we see
Birds Eggs their young forth hatch,
And Worms in heat of generating be
When they clouds rev do catch.

And to this opinion of Lucretius, Nicander seemeth to lean, when he affirmeth, that these Worms are nourished altogether of the earth that is moisten'd with long rain, or with some smoking shower: for making a difference between the Serpent Serpentes, and the Amphisbenæ, he thus writeth;

Stellicis pacibus, tes elminibos pelei agros
He cai entera get oia trepeli ommemias oia. Id est.
Manubris ligonis latitudo longitudo veris et qua Lumbrico,
Aut terra intemfina, qua imbrubus irrigata terra alit.

That is to say:

As broad as heft of Spade, his length like little Worm,
And fed with dreary earth, moist by clouds and rainy form.

The greater sort of Earth-worms live in the bowels of the earth, and moft of all in an open free air, and where there is some repair and confluence of people. Every morning they withdraw themselves into their secret holes and corners within the ground, fencing the entrance of them with their excrements they have voided forth, in a fair and Sunnhine weather: but in rainy weather they use to stop the mouths of their holes with some Balk or leaves of herbs or trees, being drawn a little inwardly into the earth. They feed upon the roots of thofe Plants which have any sweet juicy or moisture in them; and therefore one may many times finde them amongst the roots of common Meddow-graffe: and they do live for the moft part by the fat moisture of the earth, yet will they also greedily devour crums of white Bread unleavened, as I have often seen. In the Spring time, they first appear to come forth from the bowels of the earth, and all the Winter they lie hid in the ground, but yet if it be a very sharp and pinching cold Winter, and a dry Summer follow, for lack of moisture they do almost all die.

Besides, if you dig into the earth, or make a great motion, trampling, or hard treading upon the same pouring in any strange liquor or moisture into the same, wherewithall they are unacquainted; as for example, the juuce of Wall-nut-trees, the water wherein Hemp either seeds or leaves are
Of Earth-worms.

are foaked, or been laid to rot in common lye, and the like, they will issue out of the earth speedily, and by this means Fisher-men and Anglers do take them.

In like manner, they cannot endure Salt, or aromatical things, nor by their good will come née them, for but touching any of these they will draw themselves on a heap, and so die. Worms are found to be very venemous in the Kingdom of Mogor, and the Inhabitants there do stand in fo great fear of them, that they be destroyed and slain by them when they travel any journey; and therefore they use ordinarily to carry Beefsoms with them to sweep the plain ways for fear of further hurt. Georgius Agricola faith, that the little Worms called Aferides, are not all of one colour: for some are white, some yellow (as I remembred a little before) and others again are very black: and many of these in tilling the earth are caught up by the plough, and many found in divers places all on a heap together. These be they that destroy corn-fields, for by tharing or biting the roots the fruit dyeth.

Some say, that those Worms do moff mischief to corn-grounds, which in some places of Italy the people term Zecarde, and there are thick, almost a finger long, being naturally of a very cold constitution of body; and therefore they never use to come forth of the earth, but when the weather is pailing hot, for then will they come forth, even to the surface of the ground, as it is notably set down, by the famous Poet Homer:

\[
\text{Exs.amos. 1.3.}
\]

\[\text{Vatum Piestis labra rigitur aqua.}\]

In English thus;

By whom, as by an everlastings filling Spring.

With Master liquour, Poets lips are bal'd to sing.

Homer very fitly comparithe Harpalion when he fell down dead amongst his companions, to a silly Worm, when as seeking to escape by flight out of the battle, he was wounded to death by Meriones, shooting an arrow or fleet darr into his hanch or hip, his versus be these;

Meriones d' apionains ite chalke re oifoun.
Koi r'ebale glacon kato dexton autar oifis.
Antikon kato kufun ap' oisone eupheretofen:
Examens de' cat' authi philon en ekerin etiaron.
Thumon apionio, oile xolex epi gaias.
Kelo techno r'd' aima melan ree, deue de gaias.

Meriones autem in absuntum misit areum sagittam,
Et vulneravit oxem ad destrum, ac jagitata.
Et regione per versusam sub as penetravit:
Refrains autem illic berorum inter manum sociorum
Animam effulent, tanquam vermis super terram
Faciebat extensus: sanguisflit, effuebat, tingebat autem terram.

That is to say;

But ut he went away, behold Meriones
With braccard, did his right hip-bone wound,
Which near the bladder did the bone through pierce;
In friends deer bands, he dyed upon the ground.
So slreeth upon the earth as Worm he lyed.
Black blood out flowing, the same bedeys.

Mark well the slenderneffe of this comparison, whereby he would give us to understand the base estate, and faint heart of Harpalion. For in other places having to write of noble, valiant, and magnanimous persons, when they were ready to give up the ghost, he uethe the words Sper-duceas, Browhen, and the like to these, secretly intiminating to us, that they fell not down dead like impotent Cawards, or timorous objects, but that they raged like Lions, with grinding and gnashing their teeth together, that they were blafed, benumbed, or suddenly deprived of all their lives and tenes, &c. But here this pusillanimous and fordiduous minded man Harpalion, seemed to be disgraced by his remembing to a poor Worm, being peradventure a man of fo small effimation, and vile condition, as that no greater comparison seemes to fit him. It seemeth he was a man but of a faint courage, and very weak withall, because sharking and thrusting with his Spear or Javelin at the Shield or Target of Arieres, he was not able to strike it through. But although this famous Poet doth so much seem to extenuate and debase a weak Worm: yet others have left us in their writings such commendations of their singular ufe and necessity, for the recovery of mans health (then which no earthly thing is more pretious) and have so nobilitated the worth of these poor contemptible Creatures, as I think, nature as yet hath scarce given any other fimple Medicine, or experience found out by tract of time, nor knowledge of plants by long study hath revealed; nor Paracelsus by the Dithilations of his Limbeck hath made known to the world, any secret ended with so many vertues and excellent propereties against so many diseases: and for proof hereof, it shall not be bedefe the purpofe to examine and describe the rarest and most probable that are recorded amongst the learned.
Earth-worms do mollifie, conglutinate, appease pain, and by their terrestriall, and withall water-in humidity, do counterper any affected part, orderly and measurably moderating any excelle whatsoever. The powder of Worms is thus prepared: They use to take the greatest Earth-worm that can be found, and to wrap them in Muslin, suffering them there to remain for a certain time, thereby the better to purge and cleanse them from that clammy and filthy slimynesse, which outwardly cleaveth to their bodies. When all this is done, they press hard the hinder-part of their bodies near to the tail, squeezing out thereby their excrements, that no impurity so near as is possible may be retained in them.

Thirdly, they use to put them into a pot, or some fit vessel with some white Wine, and a little salt, and straining them gently between the fingers, they first of all cast away that Wine, and then do they pour more Wine to them, and after the washung of the Worms, they must also take away some of the Wine, for it must not all be poured away (as some would have it) and this must so often be done and renewed until the Wine be passing clear without any filth or drossineffe, for by this way their filthy jelly, and glutinous evil quality is clear loft and spent. Being thus prepared, they are to be dryed by little and little in an Oven, so long till they may be brought to powder, which being beaten and feared, it is to be kept in a Glasse vessel far from the fire by it self. A dram of this powder being commixed with the juice of Marigolds, cureth the Epilepsie, with some sweet Wine, as Muscadel, Baltard, or the Metheglin of the Welchmen. It helpeth the Dropifie. With white Wine and Myrrhe, the Jaundife, with new Wine, or Hydromel the Stone; Ulcers of the Reins and Bladder: It layeth also the loofenesse of the belly, helpeth barrenneffe, and expelleth the Secondine, it affwageth the pain of the hanch or hip; by some the Salsitude; it openeth obstructions of the Liver, driveth away Tertian Agues, and expelleth all Worms that are bred in the Guts, being given and taken with the decocation or diliffled Water of Greman.de, Worm-wood, Southern-wood, Garlicke, Scorbus, Centory, and such like.

The decocation of Worms made with the juice of Knot-graffe, or Common, Solamons Seal, or Sarsaparilla compound, cureth the disease termed by Physicians Diabetes, when one cannot hold his water, but that it runneth from him without flay, or as fast as he drinketh. A Glyster likewise made of the decocation of Earth-worms, and also taken accordingly, doth marvellously affwage and expelle the pain of the Hemorrhoids. There be some that give the decocation of Earth-worms to thowe persons that have any congealed or clotted blood in their bodies, and that with happy success. The vertue of Earth-worms is exceedingly set forth, both by the Grecians and Arabians, to encrease Milk in womens breasts.

Hieronymus Mercurialis a learned Physician of Italy, advieth Nurses to use this confection following in case they want milk, always provided that there be not a Fever joyned withall. Take of the Kernels of the fruit of the Pine-tree, sweet Almonds, of each alike, one ounce, seeds of Fennel, Parsley, and Rapes, of either alike one dram, of the powder of Earth-worms washed in Wine, two drams; with Sugar so much as is sufficient, to be given the quantity of a dram or two in the morning, and after it drink some small Wine, or Capon-broth boyled with Rape-seeds and Leeks. Against the Tooth-ach the same powder of Earth-worms is proved singular, being decocted in Oyl, and dropped a little at once into the ear, on the same side the pain is, as Pliny witnesseth, or a little of it put into the contrary ear, will perform the same effect, as Diaforesides telleth. And thus far of Earth-worms taken into the body, and of their manifold vertues, according to the evidence and testimony of Diaforesides, Galen, Aetius, Paulus, Egeria, Myrtopus, Pliny, and daily experience which goeth beyond the precepts of all skilful Musters: for this is the Schoolmistris of all Arts, as Manilius in his second Book hath written;

*Per varios uos artem experientia fecit,  
Exemplo muniram viam.*

In English thus;

*Experience teacheth art by use of things,*  
*When an example plainly so forth brings.*

Being also beaten to powder, and outwardly applied, they do close and folder up wounds, and conglutinate sinewes that are cut, and consolidating them again in the space of seven days, and to perform this cure the better, Democritus advieth to keep them in Honey. The ashes of Earth-worms duly prepared, cleaneth Sordious, stinking and rotten Ulcers, confumung and washeng away their hard lips, or callous edges, if it be tempered with Tar and Simbium Honey, as Pliny affirmer Diaforesides faith, that the Honey of Similia was taken for that of Simbium in his time. Their ashes likewise draweth our Darts or Arrows shot into the body, or any other matter that sticketh in the skin, if they be tempered with Oil of Roses, and so applied to the place affected. The powder also cureth Kibes in the heels, and Chibblans on the hands, as Marcellus telleth, for hurts that happen to the sinewes when they are cut in pieces, Quinimum Serenus hath these verces;

Profuerit terrae Lumbrios indurae tritos,  
Quis vetus & rancor sociari avangia debet.
Of Earth-worms.

It is good (faith he) to apply to finews that are disfected. The powder of Earth-worms mixed and wrought up with old, rammith, and unfavor Barrows gresce, to be put into the grief. Marcellus Empiricus, Besides the powder of Earth-worms and Axunger, addeth further, Grounnwell, and the tender tops of the Box-tree with Oibumun : all these being made up and tempered together to make an Emplaster, he counselleth to be applied to finews that are laid open, cut alunder, or that have received any puncture, or suffer any pain or aking whatsoever. Phony faith, that there cannot be a better medicine found out for broken bones, then Earth-worms and field Mice dried and pulverized, and so mixed together with Oyl of Rofes, to be laid in the form of an emplaster upon the part fractured. Yea, to allwage and appease pain, both in the joynts and in the finews of Horses, there hath not been found out a more notable Medicine, as we may well perceive by the writings both of Eafius, Abylus, and Didymus : whereupon Cardus hath observed, that all pains whatsoever may be mitigated by their apt ufing. Cardus Chafus faith, that the Indian can make an excellent unguent of Earth-worms against the difafe called Eryspelas, being a swelling full of heat and redneffe with pain round about, commonly called S. Antonius fire : And thus it is prepared : They flitl take Earth-worms alive, feeding them either with the leaves of Musa, or else with fine Meal, until by this means they grow fat, afterwards boiling them in an earthen vefel, (remembering ever to feem the fame) they do drain them, boyling them yet again, to the confidence almoft of an emplaster, which if it be rightly prepared is of a yellow colour. And this Medicine may well be used for any burning or fcaling. My purpofe is not to vouch all those authorities I might, concerning the admirable Nature and vertue of Earth-worms: for lo I think I might alledge fix hundred more, which is not meet to be inferted in this place. I will therefore now passe to their qualities and medicinal ufe for irrational creatures.

Pelagius much commendeth Earth-worms as an excellent medicine for the Bots or Worms that are in Horses, and in the bodies of Oxen and Kine, afffirming that the belt way is to put them alive into their Nothirs, although without question it were far better to convey them into their maws by the means of fome hore. Tardinau advifeth to give the powder of Earth-worms with fome hot fleth, to Hawks when they cannot exonerate nature (or how Faulkners teem it, I know not.) For that (faith he) loo fen their bellies. Moles do also feed full favorly upon them, and if they fall a digging, it is strange to fee with whatudden haft and speed then poor Worms will infamous out of the ground. In like fort Hogs and Swine (as Varror writeth) by their turning upon the mud, and rooting in the earth with their fnows, do by this means dig up the Worms, that they may eat them.

Albemus Magnus faith, that Toads do feed upon Worms. Bellonius faith, that Lizards and Tanentims, that the Sea-fiyth called Gryff or Empire, doth greedily devour them, and finally experience it felf witnefleth, that Frogs, Eels, Gudgeons, Carps, Breams, Roches, and Trowts, do fatisfie their hunry guts by feeding upon them. Arifotle in his eighth Book De Nat. Animal Cap. 3. describes a certain Bird that liveth in the waters, which Gaea interpreteth Capella, though the Philofopher calleth it Asis, and fome have called it Uthelius, that liveth for the moft part upon Worms: yea, Thrufhes, Robin-red-rafts, Mun-murderers, and Bramblings, Hens, Chaffinches, Gnat-snappers, Bull-finches, and all forts of Crows will feed upon them; and therefore it is that there be more Crows in England, than in any other Country in the world, refpecling the greatneffe,because here the boif being molif and far, there is abundance of Earth-worms serving for their food, as Pol- devus Virgilii in his fift Book of the History of England, (which he dedicated to King Henry the eighte) hath excellently delivered it.

The people of India, if we will credit Manoeus, do make of these Worms divers juncates, as we do Tarts, Marchpanes, Wafers, and Cheefe-cakes, to eat instead of other dainties. And the inhabitants of West-India do devour them raw, as Francis Lopes teelfith. The people of Europe in no place that ever I heard or read of, can endure them to be set on their Tables, but for medicinal ufe, only they defire them. Plutus ufed in head of a proverb this that followeth;

None ab transfensa hic turdus Lumbriicum petis.

It is an allegory taken and borrowed from a gin or snare wherewith Birds are taken: by which Chryfus the bond-man bringing certain Letters to Nicobulu an old man, dignifith and givet warning, that the weak old man was by the reading of the letter no otherwife enframed, intangled, and deceived, then fome Birds are taken by subtle and crafty fliers. For Tranfensa is nothing but a deceitful cord stretched out to take Birds, especially Thrufhes or Mavifles withall, and Worms is their proper food, which while they endeavour to entrap, they themfelves are deceived and taken. Surely I fhould not think that thofe Fishers and Anglers be very wife, who to take Worms, ufe to pour lye or water into the earth wherein Hemp, Southern-wood, Centory, Wormwood, or Vermin have been long fofaked, or any other fpangle moifure, cauine them by this mean to infuce forth out of the earth, for the Earth-worms by this kind of dealing being made more bitter, unfavourable, and unpleafant, no fishers will once touch or eat them, but rather seek to avoid them. But contrarywise, if they will let them lie a whole day in Wheat-meal, putting a little Honey to it, and then put their books with them, they will be fo sweet, pleafant, and delectable, as that the unwary fisher will sooner bite at it, then at Ambrosia, the very meat of the Gods.
Earth-worms do also much good to men, serving them to great use in that they do prognosti-
cate and foretell rainy weather by their soilain breaking or sifting forth of the ground: and if
none appear above ground over-night, it is a great signit will be calm and fair weather the next
day. The ancient people of the world have ever observed this as a general rule, that if
Worms pierce through the earth violently, and in haste by heaps, as if they had bored it through
with some little Auger or Piercer, they took it for an infallible token of Rain shortly after
to fall. For the Earth being as it were imbured, distained, made moist, and moved with an
imperceptible motion, partly the South winde, and partly also a vaporous air, it yeeldeth an
caste passage for round Worms to winde out of the inward places of the Earth, and into the
moist soil, and to midnite store of fat juyces, or fattish jelly, wherewith they are alto-
gether delighted.

Some there be found, that will fashion and frame Iron after such a manner, as that they will
bring it to the hardnesse of any steel, after this order following. They take of Earth-worms
part, of Raddish roots one part, after they are bruised together, the water is put into a
Limbeck to be distilled, or else take of the distilled water of Worms l, iiij. of the juice of Raddish
l, ii. mix them together, for Iron being often quenched in this water, will grow exceeding hard.

Another. Take of Earth-worms l, iiij. distill them in a Limbeck with an easie and gentle fire, and
temper your Iron in this distilled water. Another. Take of Goats blood so much as you please,
adding to it a little common salt, then bury them in the earth in a pot well glased and luted for
thirty days together. Then distill after this the same blood in Balneo, and to this distilled liquor, add
so much of this water of Earth-worms. Another. Take of Earth-worms, of the roots
of Apple-trees of Rispers, of each a like much, distil them apart by by themselves, and in equal por-
tions of this water so distilled, and afterwards equally mixed, quench your Iron in it, as is said be-
fore. Antiquus Galium.

It shall not be impertinent to our matter we handle, to add a word or two concerning those
worms that are found and do breed in the snow, which Theophrastus in Strabo calleth Oipan: but be-
cause it may seem very frande and incredible, to think that any worms breed and live only in the
Snow, you shall hear what the Ancients have commited to writing, and especially Strabo his opinion
concerning this point. It is (faith he) received amongst the greater number of men, that in the
snow there are certain clots or hard lumps that are very hollow, which waxing hard and thick, do
contain the salt water as it were in a certain coffin; and that in the calm and pure air those do breed
worms. Strabo call them Oipan, and Apolloniodes, Vermes.

Aristotle faith, that living creatures will breed also even in those things that are not subject to pu-
trefaction; as for example, in the fire and snow, which of all things in the world, one would take
never to be apt to putrefie, and yet in old Snow Worms will be bred. Old Snow that hath lyen long,
will look somewhat dun, or of a dullish white colour, and therefore the Snow-worms are of the same
hew, and likewise rough and hairy. But those Snow-worms which are found to breed when the air
is somewhat warm, are great, and white in colour, and all these Snow-worms will hardly fir, or
move from place to place. And Pliny is of the same judgement, and the Author of that Book which
is intituled De Platis, falsely fathered upon Aristotle.

Yet some there be that denying all these authorities, and rejecting whatsoever can be objected
for confirmation thereof to the contrary, do stoutly maintain by divers reasons, that creatures
cannot breed in the Snow: because that in Snow there is no heat, and where no quaking heat is, there
can be no production of any living thing. Again, Aristotle writeth that nothing will come of
Ice, because it (as he faith) melt cold: and hereupon they infer that in all reaso, nothing like-
wise can take his beginning from Snow; neither is it credible, that husbandmen would so of-
ten with for Snow in Winter to destroy and confume Worms, and other little Vermine, that else
would prove so hurtful to their corn and other fruits of the earth. And if any Worms be found
in the Snow, it followeth not strightways that therein they first receive their beginning, but ra-
ther that they first come out of the earth, and are afterwards seen to be wrapped up, and lie on heaps
in the Snow.

But by their leaves these reasons are very weak, and may readily be answered thus; that whereas
they maintain that nothing can breed in the Snow, because it is void of any heat at all, herein they
build upon a false ground. For if we will admit credit to Aristotle, there is nothing com-
pounded and made of the three Elements, that is absolutely without heat. And Aristotle in his first
Book De Generatione Animalium, teellith us precisely, that there is no moisture without heat. His
words are Ondi sunt in natura therma. Now Snow is a compact, and fast congealed substanct, and
somewhat moist, for although it proceeded by congelation, which is nothing else but a kind of
exication, yet notwithstanding the matter whereof it first cometh is a vapour, whose nature is
moist, and with little ado may be turnd into water.

I must needs say that congelation is a kinde of exication, but yet not simply: for exica-
tion is, when as humidity goeth away, it putteth forth any matter, but in Snow there is no hu-
midity that is drawn out, but it is rather wrapped in and inclosed more strongly, and as it were
bounded round. Furthermore Aristotle in his first Book of his Meteors faith, that Snow is Nubes
congelata, a cloud congealed or thicked together, and that in Snow there is much heat. And in his
first Book De Generatione Animalium, he further addeth, that the whiteneffe of the Snow is caused
by the air, that the air is hot and moist, and the Snow is white; whereupon we conclude, that
Snow
Snow is not so cold, as some would bear us in hand. I well hold that nothing will take his Original from Ice, in regard of his effectual coldness, but yet snow is nothing nigh so cold as that. So then all the hinderance and let is found to exceed of cold, which is nothing to effectual or formidable in Ice, and the cold being proved to be far leffer, there can nothing be alleged to the contrary, but that it may perpetue.

Now in that Snow is such an enemy to Worms, and many other small creatures, as that for the most part it doth destroy them, yet it followeth not, that the reason of Aristotle is quite overthrown: because (as we daily fee) that those creatures which live in the air, will for the most part be suffocated and die in the water; and contrariwise those that live in the water, cannot endure the air. Yet hereupon it followeth not, that if they be choked in the water, that none at all will live in the water, and the same reason is to be alleged concerning the air. Therefore it is no marvel if those Worms that first breed in the earth, and live in the earth, be killed by the Snow; yet it neecessarily followeth not, that no living creature can take his first being either from one or in the Snow. But if it can, as Aristotle wittreth, it is so far unlikely that the same Snow shoulbe the destroyor of that it first was bred of, as I think rather it cannot live separately, but of necessity in the same Snow; no otherwise then fishes can live without water, from which they first sprung and had their beginning.

And to this opinion leaneth Theophrastus, in his first Book De Caufis Plantarum, whose words be these, Apertum que fieri, tali es, non, ut planta, utiaminita, uti genetmen, en hoc ordinario, quo: For all creatures (faith he) whatsoever seem, both plants to remain, and to be generated and bred, in their own due and proper places. And after this he addeth and urgeth a little further, Abintur men huea lunton; from his own home and special particular place of abode, nothing can suffer, suffer, harm, or be corrupted. And in his first Book De caufa plano, he fetteeth it down more peripatetically, how that Worms which are bred in some special trees, are afterward translated and changed to other trees, where they never came before, cannot possibly live. Wherefore it is more consonant to reason, and more agreeable to common fene, to affirm that those Worms which are found folded and rolled up in the Snow, to have been first bred in the same Snow, rather then to have issu'd out of the earth.

Neither are we to make any question or scruple concerning their food; for there is no doubt, but the mother from whence they proceeded, will provide sufficient nourishment for her own children. For as we said a little before, the Snow is no simple thing, but compacted and concrete together of many, and of this nature ought every aliment to be. Julius Caesar Scaliger is of this minde, that Worms are engendered and brought forth in the very Snow, because there is in it much air and spirit, which afterwards being heated and brought to some warmth together, may cause them to generate; for it is the nature and quality of Snow to make fat the earth, of which fattish moisture or Jelly, there may (heat being joyned) be produced a living creature.

There be some that do constantly hold, that in the mid of certain stones, of which they use to make Lime, there do breed divers creatures, of very different kinds, and sundry proportions and fizes, and likewise Worms, with hairy backs, and many feet, which are wont to do much harm to Furies and Linbckels where they make Lime. Yet Caelinim in his first Book De Metal, chap. 2. thinketh the contrary, as putting us that in Metal-mines, Quarries of Marble, and other fones, there can never any living body be found. And yet in Rocks of the Sea, within the hollow places and rifts of the fones, they do commonly finde certain small living things called Deldith.

I do not doubt, whatsoever he faith to the contrary, but that many creeping, and other living creatures, may be found both in the secret Mines of stone, and sometimes also amongst Metals, although it be seldom seen. And for confirmation hereof, I will alledge one example happening not many years since in our own Countrie. At Harlestone a mile from Holclney in Northamptone, there was a Quarry of free fone found out, of which they digged for the building of Sir Christpher Hattones house, where there was taken up one being a yard and a half square every way at the leat, and being cloven andfurer, there was found in the very mid of ita great Toad alive, but within a very short space after, conning to the open air, it dyed. This fone amongst others, was taken very deep out of the earth, it was split and cut asunder by one whose whole name is Lotte, an old man yet living at this day; it was seen of five hundred persons, Gentlemen and others, of worthy repute and esteem, the most part of them living at this hour, whole attestation may defend me in this report: and surely if Toads may live in the mid of fones, I can see no reason but that Worms may there be found, but as yet I could never see it.

In the year of Grace 970, at what time Romualdus the son of Sergius a young Monk, was advanced by the Nobility of Rome to be their Archbishop, there followed a great death and mur- rein among Earth-worms: after that again enu'ed scarcity and death of all fruits of the earth, as Carolus Signum in his Chronicle of the Kingdom of Italy declareth: Henry Emperor of Rome, the son of the Emperor Henry the third, as Craultius hath written, when he took his voyage into Italy, being suddenly stayed of his intended course, with an Army sent against him by Matild, that he shoulde passe further then Lombardy, yet having taken Mutina, a. a. a there
there appeared a strange and uncouth sign in the air, for an innumerable company of Worms, smaller and thinner than any Flies, did fly about in the air, being so thick that they might be touched with any small flick or wand, and sometimes with the hand, so that they covered the face of the earth one mile in breadth, and darkened likewise the air two or three miles in length. Some did interpret it as a sign or fore-telling, that some Christian Prince should go into the Holy-land.

In the year of our Lord God one thousand one hundred and four, there were seen divers fiery and flying Worms in the air, in such an infinite multitude, that they darkened the light of the Sun, seeming to deprive mens eye-sight thereof; and shortly after this monitory and unnatural wonder, there followed other strange and seldom-seen prodigious sights on the earth: and what a boisterous storm of troubles, and raging whirl-winde of War and blood-shed shortly after ensued, the event thereof did plainly manifest.

FINIS.

THE THEATER OF INSECTS:
OR,
Lesser living Creatures.

As,
BEES, FLIES, CATERPILLARS, SPIDERS,
WORMS, &c. a most Elaborate Work.

By THO. MOUFFET, Doctor in Physick.

LONDON, Printed by E. C. 1658.
To the Noble Knight, and the Kings chief Physician, Dr. William Paddy:

Theodore Mayerne, Knight, Baron of St. Albons, and Companion to the chief Physicians in the Court of Britain, wisbest much health.

Our Countryman Monfett, a notable ornament to the company of Physicians, a man of the more polite and solid learning, and well experienced in most Sciences, had formerly entituled this work of Insects to the ever famous Elizabeth, (who was wife above her Sex, valiant, born to reign well, and ruled so many years by the Vores of her Subjects, and by her own undertakings and actions, that were so successful that they were envied at,) it was begun by others, but augmented by him, polished, and as it now comes forth exactly perfected, and he thought it no indignity to Dedicate to the greatest Prince the miracles of Nature, which are most conspicuous in the smallest things; which exhibits the infinite power of the supreme Creator of all things, and raise the minds of Princes who are the children of the most Highest, to the cause of all causes, that they may in all places acknowledge the presence of the Deity, and his bountiful hand in his singular direction in respect of them, and his influence that acts by election, and may adorn him with an humble, as with a grateful mind; so weighing by reason the degrees of proportion, that he is most obliged who hath received most. The Author before he could accomplish this purpose, died; he was worthy to have lived longer for the advantage of Art and Learning. Thus the Book was left after his death to his Heir, who had a smaller estate than joined with the name of his Father, or his merit required, and his many watchings and labours sustained for the publick good, in curing of the sick, justly deferred. Fortune is blinde and will hardly favour those that are the best but against her will, as if it were disagreeing and disseminating that there should be any commerce between Pluto with Apollo, Minerva and Mercury. Elizabeth being then holding the reins of the British Empire piously and justly, and ruling peaceably amongst the sorts that at that time shook all Europe, having weeded out by his Majestick Scepter, and by the providence of his soul which was prudent even to miracle, all Monsters, which endeavoured to shake the foundations of the Kingdom by Treason, Deceit, Wickedness, Lust, and Wrath. The Overseers of this Orphan left in a very poor condition, were resolved to Dedicate this learned Work to this Noble Heros, who was no less famous for his Learning than for a concourse of all Virtues that met in him: but great poverty at home, delayed the busines, and hindered this windy intention from taking effect, and the off-spark from coming to the light. So the Book lay for a long time in obscurity under the custody of the friends of the Author departed, until such time as it was offered to me by Darnells, who was formerly his Apothecary, and a very honest man, who wished well to his Master being dead, and was very desirous of his glory; so it lay for some years in my Study cast aside in the dust among Worms and Moths; truly it was no fault of mine, but of the Printers, who were so greedy of Money, that though in many Countries I invited them by my Letters, and did solicit them to receive the Orphan, yet they refused (as they said) to take upon them an unthankful busines; they were not pleased with the benefit of a noble Art, unless it would pay more than the straight. Of the times wherein the pains of learned men are valued at the price the work will be sold for, and the money that must be laid out for ink and paper, or by the depraved opinion of the vulgar (who commonly applaud what is worst) and not by the essence of the thing itself, or dignity of the subject, or the solid explanation of the same! Then there was an Epistle prefixed to the beginning which men call Dedication, which being it was to carry the name before it of one of the foresaid Princes, the Edition seemed to come forth unseanably after they were both dead. Perchance some other man would have catch'd at this occasion, to have brought it to King Charles, the great Son of a great Fa-
ther, under whose fortunate reign in his Kingly person, all Kingly virtues run together in troops, each striving to have the upper hand) and kneeling down before his Majesty, would have offered unto him, in hopes of a reward, another mass Works would with a falte cover of commendations, or obscured with the great smoke of courtly eloquence. But I have no such genius, for though I have not lived hitherto unwellcome to Princes, yet I have learned by long practice, that we must use their favour soberly, and never to abuse their ears or eyes, and though you do know efface entrance and fit times to come into their presence, yet opportunity is always unfeasable, and especially that which hires mercenary Mules for money to fet them forth, which are branded with marks of infamy. Do not think that I depret to much from this Work that I think it not worthy to carry the name of a King in the Frontispice, and might live in prouck under the protection of so ambitious an Incription; but I held it no lefs than sacrilegious to name the childe instead of another of my own accord, or to bring a deac person upon the ftage, as to what concerns the exposition of the Argument, and with other birds feathers in the very entrance of the work foolishly and vainly to pride myself: yet that the Book might come forth evry way compleat, and that the Reader who is a lover of the custome may not desire an Epiftle, or complain that there is one wanting, according to my manner (wherewith I honour great men with the honour that belongs unto them, but my friend I respect above all, and that continually) I would prefix to this Natural and Phyfical History the famous name of some man, who by the common content of the Learned, is well acquainted with both, and who is joinced unto me by no ordinary alliance, who is dear to all good men, and eminent for his own endowments; which office of Reverence and good will may testify to posterity, in what esteem such men are with me, who are intrinsically furnished with the real tincture of manifold learning, but chiefly with that of the most noble Art of all, which I practise: so I have made choice of thee alone amongst many, that thou mayst be to me in stead of them all, Noble Man, my dearest friend Paddy, who art Knighted by the wiseft Monarch James, who never did any thing vainly, who adornst thy Virtues by thy Titles, and thy Titles by thy Virtues, as our Tho
tius hath written of thee. Thou art he who after the wicked Parricide of Great Henry, formerly my moft milde Matter (which shall for ever convey the said memory of his age to posterity) when I was called by the moft Serene James from the French Court by his own Letters, and by a guide appointed to conduct me into Britain, and was immediately honoured with the title of Companion of the chief Physicians, didst not look upon me with bleer and swoon eyes, with the vipers venom of envy; but thou didst entertain me, being a stranger, candidly, and with a cheerful countenance, as it becomes one of noble Birth, contrary to that of Horace, who accuseth the Britains divided almost from all the world, of fierceness toward strangers. After that, in the many meetings we had amongst sick people, and in my prouce in Physick, when I pleasantly hearkened to the opinions of thole that consulted, weighed them, and as it belonged to my place, concluded what was to be done, thou didst hear me without brawling or contradiction, which is the imbred evil custome of some unworthy Physicians; and thou didst very often approve of my opinion, as confirmant to reason. In the famous Colledge of London, (where as thou wert alwayes moft worthy, fo thou wert of ten President) when I was by the votes of the chief, and first of all by thy suffrage made a Colleague, according to the Kings Character for my place at Court, thou didst willingly suffer me to have the next place to our President: I farther add, that thou didst never oppose thy self to the many petitions or commendations that were offered by me to our moft excellent Colleagues, but thou didst alwayes afford me thine ear to hear me, and thy hands to help me. Lastely thou didst alwayes praise me being absent, and as far as it was thy power, of thy own accord, from the imbred motion of thy noble minde, thou didst defend my good name privately wounded by the calumnies of envious men, and torn by malice, which is the condition of good, and of the greatest Princes) by that authority which thou hast amongst thy own Courteymen of what condition for- ver, and thou wouldst not suffer this scab of backbiting to proceed any farther. O moft excellent Man! what shall I repay unto thee, who as a true Philosopher, haft no defire of vain glory, and such things as make a great shew and are vulgarly praised, bought for, and defined by other men, are now esteemed base with thee? My grateful minde, and moft full of love towards thee, commands me to offer this small token to thee in testi-
mony
The Epistle Dedicatory.

mony thereof, which a cept freely and willingly, and suffer that by this sincerest gift, that wicked laying may be disanuiled, that men of one profession cannot endure one the other. God the best and the greatest hath granted unto the long life, by a prosperous aspect of the Stars, for the good of thy Citizens, whose health thou hast preserved and restored by thy care for many years effectually hitherto, that posterity must justly acknowledge that thou hast lived long, worthy not only of a Garland of oak, but a Statue of gold also, (if our times would afford such honour). Now thou well deserving Captain, discharged by age, thou Champion freed by reason of years with a token of honour, thou conqueror of monsters, that daily spring up with too fruitful an increas for the destruction of mankind, dwellest with thy felt, thy foul yet sustaining thy dry body yeading to awaiting time by degrees very easily, which being defiled with no conditions of her prion, sees the Haven, and is almost come into it; thy minde being abstracted from the sad vexations of humane life: and what time thou hast to spare from divine Meditations, penetrating into all Nature, and the secrets of things, thou dost expatiate into the pleasant green Gardens of various natural Philosophy. Behold here is a most exquisite Garland for thee gathered out of the most secret Orchard of our great Parent, which will not only feed the eyes, but will lead the singular acuteness of thy wit, which thou abounds with, into her most hidden places. Thou being an excellent Anatomist, I beseech thee try if thou canst discover Invisible, the great Stagyrite being thy guide, who did not disdain to fetch into the parts of Animals. Thou shalt finde in the little body of Bees a bottle which is the receptacle of Honey sucked from flowers, and their legs loaded with Siemens which sticks fast to make wax. Also in the tail there is a horny sting full of revenging poylon, that is ready to draw forth as soon as the Bee pleases; but the King of the Swarm is said to want one, for there naturally belongs to the supreme power, who can overthow all when he will at his pleasure, and there ought to be an inbred gentleness, whence it is that Kings by their proper attribute are called Fathers and Parents of the people. In Gnats you shall observe their sounding trumpet that will suck blood out of Animals, and will draw out moisture through the joints of the most fold wood, and wine-vessels. How wilt thou be pleased to see the small proboscis of Butterflies woven always into a spiral line, after they have drawn forth nutriment from flowers, their extended large wings painted by nature's artificial pencil, with paints cannot be imitated; to which the very Rain-bow is scarce comparable;

Which right against the Sun a thousand colours shows.

What a pleasant spectacle will this be when the artificial hands carefully and curiously guide the most sharp pen-knife, and very fine instrument by direction of the light! To behold the pipe of the Grailhoppers that live upon dew, and the organs of the thril found they make, that in the heat of the Dog-dayes incomparably bears upon the ears of travellers, which are so framed, that their concave belly is made vaulted under the Diaphragm, over which is extended a cover of a thin and dry membrane, like to a Drum, which lets in the air by an oblique turning, which being beaten by the regular and successive motion of their wings, and flomach, coming in at a strait passage, and presently dilated, beating against the rough-cast walls of the hollow place, and refracted, makes a sound. To see the horns of the great Beetles, that are like to Stags horns, and with sharpest points are able to make wounds, and the muscles that move them, and ye them on exceeding fast. The Rhinoceros is of the kind of great Beetles. The swelling purifie which is the matter of the silk, and is wound back again into many turnings, by Silk-worms which are chief of all Caterpillars, of divers forms and colours: in which after the time designated for the concoction of their food, which is gathered chiefly from Mulberry-leaves, a tenacious glew or jelly is reserved, untill such time as their ventricle swelling, and nature affecting to attain her end, the Worm by degrees belaceth forth her spittle, the thread whereof growing firm by the air (which is provided to make garments for great men) this little creature dispenceth through her very narrow claws, and spinning with the motion of her head and of half her body, with the keeming of it by the help of her forefeet, she first dispooeth it for the strengthening of her clew of yarn, and after that upon her own sepulchre where she must receive her transmutation. How the Spider thrusts out her excrements by her lower parts of her body, which is drawn...
forth into a web, of which the poor creature frames nets with great labour, which are necessary to sustain her life; and with her long legs that end in sharp claws, the knots them into knots, being continually obnoxious to repair her work. In the uppermost cafes of the green Locusts which feed upon hedges, there are two scales that are hard as horn, the mutual rubbing together whereof by the ministration of the air beaten with their softer wings, make a very sharp sound. The head of all of this kinde is armed, their hinder legs are hard, dry, long, by the vehement thrusting whereof against some firm object, with the help of their most strong tendons they will cast their body a great way, being equally ballanced, and is heavy enough for the proportion of it, like an arrow coming forth of a bow, as it happens to Fleas that leap with a huge force. But which is yet more, besides their pincers which are as sharp as keen razors, where is a direct pilage from their mouth to their tail; the pylorus is compassed about with toothed bars, that answer one the other with a thorny gomphosis, wherewith they destroy whole fields with devouring fore-teeth, like chisels, and grind them as it were in a mill, and very suddenly they void it forth again; their hunger never ceases until the vile creatures have consumed whole Countreys which God is angry with, divine revenge commanding them, and brings to nought that people, who ridiculously threaten heaven with destruction. You shall see the sharp spacers that arm the mouth of the Spiders Phalangia, and by the small wounds they make, a strange venom enters, and penetrates into the center of the body, and sticks fast to the deepset marrow, lasting so long in the subject which receives it as the cruel beast lives; and is exasperated periodically at certain hours, troubling the phantastic of the perfons wounded, which is abated with colours objected like to this Spider; yet it ceaseth not to rage, until mufick caufeth them to dance, and provokes them to sweat abundantly, whereby the paroxysm is dissolved, which the day following returns at the same hour. You shall behold the internal fire of Glow-worms fastned to their tails, and the torches of the Indian Cocuia that shines in the night, and overcomes Cimmerian darknes. And moreover, if you take lentillar opticke Glasses of crystal, (for though you have Lynx his eyes, there are necessary in searching after Atoms) you will admire to see the dark red colour of the Fleas that are curialhers, and their back blishe with brillies, their legs rough with hair, and between two foreyards there stands a hollow trunk to torture men, which is a bitter plague to maids, and is the greatest enemy to humane reft, especially when that men would sleep. You shall see the eyes of the Lice flicking forth, and their horns, their body crannied all over, their whole substance diaphanous, and through that, the motion of their heart and blood, as if it floated in Universe. There will appear to thee the flat bodies of the petulant Crab lice, with their grapples, wherewith they perpetually lance mans skin between the hair with their mouth, and tick on faster than Cockles do to the rocks. Alfo little Hand-worms which are indivizible they are so small, being with a needle pickt forth of their trenches near the pools of water which they have made in the skin, and being laid upon ones nail, will discover by the Sun-light their red heads, and feet they creep with all. And if from the inspection of parts you will recall your minde to consider the generation and beginning of Insects, and will weigh the various trammutations which they undergo, as of Worms into Flies, of Catterpillars (the feveral species whereof have their original from the corruption of feveral vegetables) into Chrystals, (that shine as if leaves of gold were laid upon them) and Butterflies, whose eggs again produce an offpring like Worms, Nature acting successively in a circle, and constantly by a perpetual motion running back into her fell; you will doubtles enter upon a large field of Philosophy concerning three Kingdoms of the universal spirit, (the Vegetable, Animal, and Mineral) equally penetrating, replenishing, and governing, and upon the power and activity of it, introducing divers forms into beings that pertain to each of them, according to the disposition of the matter: also the commerce of all sublunary bodies amongst themselves will exercise your contemplation, which though oft times they seem to fight one against the other face to face, yet they agree in one, and from one the other, all and each of them borrow something. And if Animals and Plants be transmuted, why should that be denied to Metals? which thing, many genuine Minifters and legitimate helpers of Nature boast, and not without reason, that they can do it by Art: and that only by removing of impediments, and by a convenient application together of actives and passives; which being done, the Philosopher leaves the whole work.
The Epistle Dedicatory.

work to Nature only, which by a gentle outward heat, being helped without too much haste, doth raise up an internal fire; which is the Workmaster of the Elixir that must procure health and riches: that I may hifle our Asles, who triumphing in the Lions skin, erct a tumulous and confused furniture in their Laboratoris, and dig forth all things under ground from the very bottoms of Mines, and melt them in the fire, being desirous to make trial of their own dreams.

Their Patrimonies they together pack,
Plying their hidden work with Coles fall black,
When they have spent, and labour'd all in vain,
Nothing they finde, nothing they seek again.

But passing over these blowers of the Asles, if you be pleased to reason deeper concerning Insects; you shall finde what will exercise you in the Monarchical government of Bees, the Democratic of Ants, and the economical providence of them both: of that in gathering and laying up Wax and Hony: of this in replenishing her granaries, and biting aunder the grains of corn at that end where they spring forth, left the provision which is gathered with hard labour, and laid up for winter, by the force of an imbred heat in their work-house under ground (which is hot whilest the Winter lasts) should corrupt, being spoyled by a sudden production, and a plague arising, together with a famine overspreading, should destroy the whole neft. Nor can you lightly pass over the Architecture in filling the cells in the combs of wax, mathematically to an exact Hexagon, in the hollow places of a Waps neft; in the various chambers of the Ant-hill, and winding Meanders in the joyning together whereof he saw granaries, chambers, hospitals, places of burial, besides the innumerable endowments of these indefatigable creatures, their functions and labours, and he could not admire or praze them sufficiently, who had spent a long time in the contemplation of them, thinking it a work worth his pains, his whole life past being employed in this negligent and very idle busines. Silk-worms, Caterpillars, and Spiders, shew their art in spinning, making fnares for Flies, and pitching their nets to provide themselves victuals. The Wood-worms practize graving, with the raps of their mouths piercing into the timber: Ants and Bees, amongst other Insects, will teach men pietie toward old men, tired, sick men, and their own children: Oyl Beetles sacred to Apollo, will teach them to love their off-spring, who never cease for 34 days to row up and down a dung pil, (which is the receptacle of their feed) from East to West, following the Suns motion, until it be fit to hide in the ground for the production of their young, after the space of a Lunar moneth, which nature hath allotted for the forming, and excluding of this Wom, which shall at length become a Fly. Here take notice that the male hath a proflic feed without help of the female, and can generate by itself pithification of matter interceding in a convenient matrix, though it be not animal. But (that which crowns all the meditations of a Christian man, and carrieth him aloft) consider how the Silk-worm makes her self a tomb, that is unpassable, by reason of her woven work that is most compacted within, in which the Worm contracted into it self seems to die, and by a prodigious metamorphosis its born anew a Butterfly, a more noble creature, which by the weaving of its wings flies up into the air toward heaven, whereas before its burial it lived a base creeping creature fastned to the earth, and glued to the food of the ground. See whether a little beast that is obscure, of the kinde of Locusts, living among the stubble of the fields, when she is confumed with extreme leannes (which from the posture of one that is praying, the French men of Narbon call Pregaden) do not teach men to hold up their hands in prayer unto heaven, and admonish them to observe a convenient gesture in offering up their supplications unto God. What think you of the greater Beetle, the Indian Rhinoceros, which being bred without a female (as the rest of the like kindes are) dies, and riseth again out of her own corruption, like a Phoenix, after her chage, when she was supposed to be wholly dead. Lastly, what think you of Flies, which when they are drowned many hours in water, if you bury them in hot embers, you shall revive them again. Truly I doubt not but that amongst those feerious cogitations, (the object whereof will seem not fo serious in respect of other false appearances of men, that are illiterate and unreasonable) thy minde may rise to its original, and fastening thy eyes on heaven inspired by
The Epistle Dedicatory.

God, wilt cry out, O the depth! and with the divine Psalmist wilt return a Psalm of thanks to the Maker of Nature: How wonderful are thy works O Lord! In wisdom hast thou made them all, the earth is full with thy possession. So shall I have whereby I may rejoice; that however the whole course of thy age hath been but one continual act of Philosophy, yet that by the rare advantage of this Present which is curious with variety, I have given thee a new occasion of no lefs solid and profitable, than of pleasant and ingenious meditation. Suffer therefore that a friendly hand may convey into your Library the Offspring of the most learned Muniffet, which is now at last published and brought to light, and amongst so many volumes wherewith thy Study shelves are most excellently furnished, assign a place for it, whereby the Father and the Son. Besides the good things mentioned shall from hence accrue unto thee, and the very great increase thou shalt reap from the hours thou shalt spend in reading the Book, (if I may speak with thee) thy own profit shall not want its advantage, left thy proper benefit should here seem to be neglected. In these leaves thou shalt finde what will drive away the plague of thy delights, those beasts that are the greatest enemies to the Muses and their darlings. I mean the Moths that devour Books, which with a greedy belly and iron teeth (though their bodies be very small) prodigally waste and rend the lucubrations of whole ages. Let those evil beasts that are the most deadly mischiefs of angry nature be destroyed after an ill manner: to prevent the propagation whereof, and to kill their infamous progeny (whilest in the mean time learned writers of Books endeavour to abolish their kind utterly, or their sedulous Collectors do what they can) this Book (which I send to thee as a remembrance of my love, will teach thee in the Chapter that treats of it. But let it suffice, I began with a small pitcher, why should the wheel run till it fill an Amphora? The heat of good will and fruitfulness of the subject carry me away; I must now take off my hand, left my Epistle should proceed absurdly beyond the bounds, which already unawares hath increased into a volume. Believe that I am affectionated to thee, and how well I wist and desire to thee, these lines I have written may speak. What remains of thy daies which God hath appointed thee to run the race of thy life, before thou receive thy heavenly reward, I wish thou maift finith without any pain of minde or body, and that I may speak with Aristotle writing his last Testament, I pray from my heart, that thou maift live longer here, for it is well, but if any thing happen, that thou maift safely arrive and enter gloriously into the harbour of the blessed at the moment decreed. Farewell.

From my Study in the Ises of Mo, and the year of Muses Redemption, 1534.
A Preface upon the undertaking of this Argument;
and of the worth and use of it.

That the History of Insects is worthy of the chiefest Philosophers, the pains of great Aristotle, and Pliny, and of our Wotton in describing them doth sufficiently demonstrate. After their time Conradus Gersner laboured not unfruitfully, to perfect that work which they began, but by reason of his short life, he fainted in the beginning of the race, nor was he able to put an end to it. But when Pennius of blessed memory met with those papers by a better fate, for fifteen years together by infinite reading of all Authors, he enriched the History by the exceeding great help of Quickelbergius, Cluflus, Camerarius, Sir Thomas Knivet, and of his most learned brother Edmund, Jo. Jacob, Roger Broun, Brite, but chiefly of our Brother, and some courtesy of Peter Turner. That is so lamented, that he also was taken away by untimely death, before he had disposed of the matter and framed it to the dignity of this work, which he had heaped up together on all sides: Hence it was that his Letters were full of blots, and confused with doubtful Characters: and they had perished, had not I laid them apart, when they were ready to be cast out of doors, and with a great sum of money had redeemed all the torn pieces of it. For I had rather something should be taken off from my own estate, than from his glory, who had spent so much pains in the description of Insects, and so much money for the Plates engraving, wherefore this Mans and Gersners and Wottons fragments being disposed in order, adding to them the light of oratory which Pennius wanted, I forgot the History, and according to my abilities (which I know how small they are) I at last brought it to a period. At first I was deterred from it by the difficulty of the work, because I saw that Insects are hard to be explained, both in respect of the unusefulness of the subject, and also of the sublime or rather supine negligence of our Ancestors in this point: for they stood still in the very entrance, and they faluted them only by the way, or as the proverb is, at the threshold of the door. I also feared that (which fell out it may be) lest there should want dignity of oratory, for so exquisite a Narration, chiefly when as I oft observed Pennius to be gravelled here, and I seldom went to those that were Artists of words. Also for a time I was detained by examining the causes of Insects; which being unknown, the History can neither be well penned, nor rightly conceived. Moreover friends check me (and that barely) that I did but rough-cast another man's buildings, as though I were one who ought for the Garland in every business, and thirled after glory more than it was fit for me. They said moreover, that since some worthy benefit and profitable end must be proposed to every business that is rightly undertaken, yet none of these was to be found in these imperfect creatures, but I should lose my time, charge and labour exceedingly. By these hindrances I was so as it were made fast to an anchor, and left off for a short time to fail any farther: and sometimes taking up my pen, sometimes calling it away again, I was in divers minds, until that certain reasons averted these flotings of my thoughts, and did again kindle, as it were, a desire in me to hoije up fail again. I opposed against the difficulty of the work, the desire of attempting things that were very difficult; remembering that for nine years Troy seemed to be impregnable, but was taken in the tenth year it was beleaguered. As for the dignity of the style, I was perfuaded that men of a sound judgement would not consider how neatly, but how well I discovered the nature of Insects; for however some mens wain wits, desire much affected eloquence, yet those that esteem of things soberly, altogether reject it. I put off the ignorance of the cause, with the answer of Theophratus, who though he sunk under his too earnest enquiring after them in plants, yet did not conceal so profitable a History. It first sufficed us to have measured the causes by humane capacity and mete-yard; for as it is the part of
The Preface.

of an ambitious man to promise a certain knowledge of them which is only in God; so to have no knowledge of them at all, is the part of a beast. The example of Galen, took away from me the fourth fample I had; who though he added to Hippocrates but a few things, except the grace of Oratory, and did only open that way of Physick which he had set down, yet he is placed in the second rank among Physicians, that many think him worthy to have the first. Which thing I have not only done in this book, (I am willing to speak the truth concerning my own work) but I have inverted entire Histories, and above a hundred and fifty pictures, which Geffner and Pennius knew not; I have mended the method and language, and I have put out above a thousand tauntologies, trivial matters, and things unseasonably spoken: for I have had regard to the squemish stomachs of men of this nauseating age, that not only loose Coleworts twice sod, but even Ambrosia twice set upon the table. Notwithstanding how small forever this my pains may appear, (for it cannot be thought no pains) be that (all make trial in something of this nature, he will rightly perceive my labour, and will of his own accord take heed how he goes to repair old and decayed houses, with new matter; it had been better to have written a new History than to have mended this which was so tattered and confused. As for vain glory, I desire it may be as far from me, as I wish the light of this History may be near to you. I confess that not to love honour is contrary to mine, and all humane nature, yet so that I hold boasting to be among the greatest vices, and I equally reject foolish ostentation in small matters. Socrates, Plato, Hippocrates, have taught us better, who in their times both wrote many things, and were exceeding far from the ambition of glory. I know not whether they were to be numbed among men most desirous of honour, who publishing nothing of their own, make unlearned men to conceive of them, that they abound with hidden learning; as if they were like butterflies, that were so full, that they drop very slowly or not at all. I shall add this concerning the dignity of this History of Insects, (left we should think God made them in vain, or we describe them) that in the wonderful world there is nothing more divine than these, except Man. For however in how they are most object and absurd, yet if we look more nicely into them, they will appear far otherwise than they promise in the bare outside. It oft times comes into my minde (faith Gallifardus) to think of our Italians, who commonly admire vehemently things notable in magnitude, or new and unusual; but things obvious in all places, and that are very small they despise; yet if they look exactly to the matter, it will be easy to observe, that the divine force and power from themselves are effectually in mean things, and they are far more miraculous than those things the world with open mouth repeat so much and admire. If any man bring from far the wonderful Bittour, Elephant, Crocodile, there is no man but runs quickly to see that, because it is a new thing and unusual; and when they have leave to see them as much as they will, they only wonder at their greatness, colour, and such things as fall under the apprehension of their senses. But no man regards Hand-worms, Worms in Wine, Earwigs Fleas; because they are obvious to all men, and very small, as if they were but the parasites of luscious and drunken Nature, and that she had been sober only in making those huge and terrible beasts. Nor is this vice peculiar to the Italians only, but it is common to the English and to all mankind, who that they may see these large beasts that carry towers, the African Lion, the huge Whale, the Rhinoceros, the Bear and Bull, take sometimes a long journey to London, and pay money for their places on the scaffold, to behold them brought upon the stage; yet where is Nature more to be seen than in the smallest matters, where she is entirely all for in great bodies the workmanship is easy, the matter being difficult, but in these that are so small and deplorable, and almost nothing, what care? how great is the effect of it? how unaccountable is the perfection? as Pliny faith. Do you require Prudence? regard the Ant; Do you desire Justice? regard the Bee; Do you command Temperance? take advice of them both. Do you praise valor? see the whole generation of Grasshoppers. Also look upon the Gnat (a little Insect not worth speaking of) that with her slender hollow needle will penetrate so far into the thick skin of the Lion, that thou canst hardly or not at all thrust a sword or javelin in so far. A man hath need of steel to bore into oaks, which the Wood worm can hollow with her teeth as the found can stab, and as if he had Polycletus his graving instrument, she carves out seats. But if I would relate the skill of some of them in building, fighting, playing, working, perhaps I might be thought over-curious in these small things, (of which the Law takes no notice) and more
The Preface.

more negligent in greater matters. Now I come to their use, and that manifold, and in respect unto God, to Nature, or to Man, very great. For if the Gentiles according to that saying of the Apostle Paul, Know God by the creatures: truly they may hence, as from a higher watch-tower behold his Omnipotence, Majesty, Providence. For some of them are so small, that like those little Callicrates drew, they cannot be seen but with good eyes, and when the Sun shines very bright: as I remember I once saw a Fly far smaller than a Worm in wine. Would you have a Musician? hearken to the Craftsmans, which is always filled with singing, and lives without meat; and by her most pleasant melody challenges the Nightingal. Would you hear a Trumpeter? hold your ear to the Beehive, hear the humming noise: hearken a little to the Goat, in whose small beat the great Master workman hath formed that horrid and clanging sound of the Trumpet. Do you despise a Louse? yet when the Egyptian Magicians deceived Pharaoh by producing the greater creatures, in the forming of this so contemptible a creature, they yielded the garland to Moses. Wherefore Galen (17. de fufu portium) breaks forth mightily into these words, after he had explained the wonderful generation of hairs, and the use of them: faith he, If there be so divine vertue in parts that are so fordid and nothing considerable, how great may we suppose the excellency of the same is which rules in the heart and brain? Truly if a man that is addicted to no feft, would freely enter into the consideration of things, considering the fabric of any even the smallest creature, and that in every part though never so bafe, so great vertue resides, he shall easily understand the excellency of the minde which is in man, and from the principles in physick shall ascend to Divinity, which is far better and more excellent than all Phyfick. I suppose that no nation nor society of men amongst whom there is any Religion of the gods, have any thing comparable to the Eleusinian or Samothracian Ceremonies; yet these do set forth but obscurely the minde of all things which they profess; which is plain enough in the fabric of all living creatures. For you must not think that in Man only the Art of the great Artificer is so great, as I have explained before, but what creature before you would defiect, you shall finde the like art and widdome to appear in it. And such creatures as you cannot possibly defiect, will make you to admire the more, the smaller they are. For if a certain Carver lately obtained exceeding great commendations, and that defervedly, because on a very small Ring he so curiously engraved Phaeton riding in his chariot with four horses, that you might fee their mouthes, bits, teeth, 16 feet, and all their parts exactly framed: truly since all that workmanship had nothing in it more excellent than the leg of a Flea, it is evident that God that made the Flea, hath more Art and Excellency in him, that not only made it, but that he did it without any labour, and when he had made it, doth continually feed and nourish it. Wherefore let us leave off to admire any longer the waft and huge Coloss, and with the chief Master of true wisdom, let us defend from the Cedar to the shrub, that is, from the most highest trees to the most contemptible weeds, or rather the most objeft of all vegetables. And if he thought that the history of the meanest plant was not unworthy of a King to contemplate and write of, how much more excellent are Animals than Plants, so much more doth this work defend the patronage of a King, and philosophical contemplation than that doth. When Heraclides had invited some of his friends to his poor Cottage, they stood only before the door, being afraid to come in because the place was so narrow, or the room so foul: to whom he spake thus: I pray come in, here are Gods also: thereby implying that the greatest God was in the smallest matters; and that there was a spirit in all things, though never so despicable. And truly, if the fabric of Insects were worthy so great and divine Artificer, how can the contemplation of them be unworthy of the understandings of poor contemptible men? Amongst the godfathers of Palestine, God raised great Goliath, a Giant amongst men; yet would he have him overthrown by the sling of one poor shepherd. Amongst the Spanish Pilots, how many tall Mariners there were yet they all submitted to one small Drake, and Neptune himself in a manner yielded up his Name to him. The Oke is great, and grows very large, but God destroys it by the slender Ily, that slings about it, that it might not grow proud of its force and might. Farewel then all those that so much esteem of creatures that are very large. I acknowledge God appears in their magnitude, yet I see more of God in the History of lesser Creatures. For here is more of prudence, sagacity, art, ingenuity, and of certain evident divine being. Wouldst thou praise Nature, Gods ordinary hand; from whence
The Preface.

Whence wouldst thou take thy beginning better than from Insects & where hast he planted so many senses in a Great, where (how Pity) hath he set the eyes? where the smelling? with what curiosity hath he fashioned the wings? with what great art hath he extended the small legs? and disposed the hungry hollow belly, and hath made it thirsty after man's blood? and as the small beak it hath cannot be seen, he hath so made it double by a reciprocal art, that it should be sharp pointed to enter, and hollow to draw it forth. I let pass that admirable variety, commodines, and secundity that is in Insects, which commend the riches of quickening Nature in greater multitudes, and set forth unto us the great plenty of it, which cannot be exhausted. If you consider men, as they cure almost all the diseases of men's bodies, (as I shall declare more at large in their History) so they furnish their minds with variety of examples of virtues, whereby they may instruct their souls, and teach them, that otherwise would be very wicked. Wherefore Solomon the principal Master of true wisdom amongst men, sends sluggish to the Aعش hill, and simul- taneous people to the bands of Locusts, and incites mortal men to the contemplation of the Spiders in their houses, that from the School of Insects we may learn virtue, and may lift up our eyes unto the power of God, which are too much turned away from him. Go so, faith Tertullian, Om: thou relief upon thy own strength, and distrust God, yet consider that there is so great strength in the smallest creature he hath made, that thou canst not endure it, nor ever be able to do as much. Imitate if thou canst the Spiders curiosity, endure the sting of the Spider Phalangium, avoid the nastiness of Lice, take a Great out of thy breast, sleep when Fleas or Wiglice bite fiercely, keep thy trees safe from Cater- pillars, drive away Weevils, Trees-worms, Vine-worms, and Timber-worms: wherefore as God shows his power more in this more notable Article of Insects, so his great mercy is more apparent, because there is hardly any disease of the mind or body, but a remedy may be fetched from this store-house to cure both. If men should deny that they contribute very much to feed, and fat, and cure many other creatures, Birds and Fishes would plead for them, and the brute beasts that feed on grass would speak in their behalf: wherefore though with many every thing that is new, or hard to obtain, is most valued, and this is excelled by the perseverance of wicked men, and ignorance of unlearned men, to be a work of curiosity, ostentation, and of no profit,

Yet see the shape of things that are so small,
Nature, and Fate, and great original.

Wherefore I exhort these chief men, which I named at the beginning, who have deserved excellent well in the History of Insects, by communicating both the things themselves and their pictures, that with that humanity they have been asfisting to me, and to Pennius Historico, they would continually proceed in the same for the augmenting of this work: for so shall they be truly accounted, as they are, Physicians sons, and shall most amply set forth the glory of God and Nature. To which if I may appear to have had as much regard as I have had to the certain profit of men by this work, I shall not regard the envy of any man, for I never studied to please all men, and yet I always endeavoured to offer unto the Creator of all things, some part of thankfulness.

OR,

Of lesser living Creatures.

CHAP. I.

Of the Names, Description, and Differences of Bees.

All Insects, Bees are the principal and are chiefly to be admired, being the only creature of that kind, framed for the nourishment of Man; but the rest are procured either to be useful in physick, or for delight of the eyes, the pleasure of the ears, or the compliment and ornament of the body; the Bee doth exceed them all in every one of these.

The Grecians give divers names to Bees according to the diversity of Nations, Countreys, and places; for divers nations do attribute divers names to them. But the most common and vulgar name is

The Theater of Insects: or, Book I.

The Bee is an Insect living creature, four-winged, bloudedeste, skilful in his artificial making of honey. For he that writ the Garden of Health, seemed to do much, by confidently affirming that Bees were four-footed beasts, for Nature only bestowed on them four feet that they might go upright, and more not, lest it might hinder their flying. But omitting this Author, let us more amply describe this most profitable and wise Insect.

Their eyes are honyey and made inwardly, and so is their flings, neither do they want tongues and teeth; they have four wings, which are dry (as those of all other insects) finnying, flattened or joined to their shoulders, the last whereof are the leafles, that they might not hinder their flying; two claws as it were growing forth of the ends of their little feet, between which in stormy weather they carry a stone to poise and balance their light bodies, left the impetuous violence of the wind should drive them from their houses; and therefore we need not give credit to Lucian, that they ought to be called Zon Andr. footedfeet creatures. They do not breath (by Pliny's favour) but pant, and are refreshed by tranpiration. Their flomach is framed of the most thin membrane, wherein they not only confere and keep their collected honey, but concoct, and purifie it; which is the reason that Bees honey may be kept longer: than any Manna or aerial body, or rather is altogether incontestable, as we will shew hereafter.

Aristotel, Hist. cap. 10. saith that there are nine kindes of Bees, six whereof are fociable, and do live together, as Bees, the Kings of Bees, Drones, Waifs, Horners, Moths. Also three solitary and infociable, the greater Siren, the lesser Siren, and the Bumble-Bee; of which kind Simius Albertus does reckon up nine, but gives them such harsh and barbarous names, that it seems he rather figned them, than knew them. Lib. 8. solid. 4. cap. 2.

But Bees do differ, and are distingushed in regard of their matter, form, wit, disposition, and office, and there are all their genuine, and natural differences, which I have collected out of infinite Authors, Concerning their matter (if we may credit the curious searchers into the works of nature) some of them are called meliponae, or the Lions brood; others seselae, the Bulls brood; and some berthulae, or the Ox brood; and some melipasea, or the Calves brood. But the best and noblest bee are generated and bred out of the Lion, and the Kings and Princes of them do derive their pedigree and descent from the brain of the Lion, being the most excellent part of his body: it is no wonder therefore if they proceeding and coming from so generous a flock, do affail the greatest beasts, and being endowed with a Lion-like courage, do fear nothing. The noblest Bees next unto these, are thoie that are generated out of the Bull, being also a strong and valiant beast, the excellency both of their disposition and bodies being equal to their flock and pedigree. The next are the Cow-Bees, or Oxe-Bees, which are indeed very industrious, laborious and profitable, but of a milder disposition, and leffe inclined to anger. The Calfes carkeLL doth generate more soft and tender Bees, excellent makers of honey, but not able to endure labour, in regard of their tendermell, and in regard of the weaknesse of their matter short lived. Some also do write, that Bees may be bred out of their own athes sprinkled with honey, and laid forth in the sun or some warm place, which for may be called in Greek ineffoama or Self-begetters. Bees of the bell flaps are small, variously coloured, round, and boding; the worser shaped are long. The difference of their forms and flapes arises from four causes; Nature, place, sex, and age. For some are domestick, or house Bees; others are wilde or wood Bees, to the delight in the familiaritie and company of men, but not the other, which do exercise themselves in making honey in trees, clefts and crannies of the earth, and in the rubbish of old houses and walls. Again, some of the tame and gentler sort of Bees do live in pleasant gardens, decked and beautified with all sorts of flowers; these are great, soft, fat, and large bellied; others are kept in villages, going far for their food, and feed on flowers; they light upon by chance. The latter more hairy, yet for their work, industri and skill, they exceed the other. Of both kindes some are bred with flings (as all true Bees are) and others without flings, as the bafldar Bees, which have a greater and fofter belly, throat and body, but not famous either for manners, or ingenuity. They call this kind of Bee the Drone, because they seem to
be laborious, and are not; or because under the colour of labour (for they sometimes carry wax and diligently fashion their combs) they devour the honey... And they are of black shining colour and larger bodied. Moreover some bees are descended from their Kings and Dukes, whereas Aristote makes two kindes. The yellow, which is the belt, and the black streaked, Others do reckon three Kings differing in colours, blacks, reds, and spotted or streaked. Morecruci doth report, that the divers coloured are an inferior sort of Bees; but these streaked and diversified with black, are the better. All of them are twice as big as other Bees. He that is elected, Monarch or King of the whole Swarm, is always of an excellent shape and twice as big as any of the rest; his wings are shorter, his chignis straight and strong, his gate loiterous, his aspect more stately and majestic, and on his forehead a white spot like a shining Diadem or Crown, differing much from vulgar Bees in regard of his shining colour. But the place doth alter, sometimes their form, and sometimes their nature, sex also and age do change them in both respects. For in the Malvoce Islands Bees are like to winged Ants, but somewhat lesser than the greater sort, as Maximiliana Transiliensis in his Epistle to the Bishop of Salisurgus eloquently relates: In America near the Rivers of Valters and Plats, the Bees are not like ours, being no bigger than those small flies which trouble us in summer; they build their nests in hollow trees, and they make far greater combs and fuller of holes; the end or tip of their wings (as Ovidius and Theophras relate) seem to be bitten or cut off, in the middle whereof they have a white spot, and they have no offensive fings. The wax which they make is of a dusky pitchy colour, and they are for the most part evil conditioned. Aristote lib. 5. hist. cap. 22. mentioned a certain kindes of Bee, that is of a soft indutrious nature, which maketh twice in a moneth, being of a gentle pleasing disposition, and bufted only in making of honey. Such there are also in the Country of Peru, which do make a soft and melting kindes of honey, which do flop their doors to close with wax, that they leave but a very small hole for their ingressie or egresse. But almost all our Bees in Europe are of a blackish colour, not so much in regard of the easy confection of thin substance, than that they seem to be of a groffer die, and of a thicker compouder; and therefore the thicker matter doth remain within the skins, which the Bees of Peru and Perus, by reason of their thin skins, and the fineness of their dewy nourishment, do easly thraught forth; unless be that the cawe, we must ascribe the variety of colour, to wanton nature: as we do for white bears, and white black-birds; which feing the her felf is various and of many shapes, it is no wonder, since the delights in variety of colours that the hath not made all Bees of one colour. The kindes of common Bees, (as Columella observes out of Aristote) are thus distinguished; some are great round black, hairy: others are leafe, round, of a dark colour, rough hair: these are yet others leafe than they, and not so round, but more fat, or of a flawe colour their fides: these are some falt of all, very flender, sharp, whole bellies are various coloured from yellow, and very small. But the blackfich are most to be approved of; that are very little, round, lively, shining, gentle, having (if we credit Virgil)

Their bodies fiove with equal spots of gold.

The greater Bees are, and fatter or longer, the worse they are: and if they be fierce and warful, they are worst of all. But their anger is pacified by the daily company of their keepers and of their minds they are made more tame with the only tinkling of bratle. The Bees called Chalcides in Crete, from the place, are of a brazen colour, and something long, and are said to be very implacable and given to fighting, exceeding all others in their fings, and pricking more fiercely: so that they have driven the Citizens out of the Towns by their fings. And Elian out of Antonius relates, that in the Mount Ida, the remainder of that race, dwell and make their combs. Such are also the Bees at Carthagea like to Muskritos. Paufanias writes in Atticus that Bees are so gentle in Halicarnassus, that they go forth to feed amongst men, and wander where they please, for they are shut up in no hives; wherefore they make their woods every where, and to that end, that you cannot part the honey from the wax. They are smooth, shining, of variable colours, and not unlike to our good Bees. Lully, since all Bees are by nature void of poiyon, yet the place caufeth the long Bees, and the diatice fashioned, about Carthagea in America, to make venomous honey; where they collect honey that is infected with the contagion of trees, winds, air, and earth it self; and be it what it will be, they lay it up in their cellars. Also Bees subcrestitial have another form and nature. For those that work in hives and trees, they are greater, longer, foffee, better wing'd, more yellow on their backs and bellies. But they are that under the earth build in little holes, form of the place, and are short compacted, with black heads and forefals, hairy almost on their whole body; a yellow down colour on their fides and nump, and that doth much adorn them. Of Bees, some finde themselves houies in woods, some are received into houses made of straw or horn; some civil and well nourished Bees, who will not refufe the care of the Bee-maftre who hath skill, but will much love and delight in it. The prince of Philosophers confounds the sex of Bees: but most writers distinguifh it; some fay the females are the greater, and without fings; others fay from their sex, they are leffe and have fings. The founder Philofohers, (whole opinion I fahow) acknowledge no male but their chief leaders, which are more strong, greater, more able, and alwayes fly at home for propagation, and feldome go forth but with the whole swarm; whom nature hath commanded to be frequent in Venus occasions, and ordained them to fly alwayes at home...
CHAP. II.

Of the Politick, Ethick, and Oeconomick virtues of Bees.

Bees are sway'd by Sovranity, not tyranny; neither do they admire of a King properly so called, by succession or by lot, but by the advice, and circumstances of their bodies, and though they willingly submit to regall authority; yet for as they retain their liberty, because they still keep their Protogative of Election; and when their King is once made, fight to them by oaths, they do in a principal manner love him. He as he doth excel all the rest in portines and feature of body (as is above said) so likewise (which is the chief thing in a Prince) in gentleleness of behaviour. For although he hath a dazing as others, yet he never ueth it to punish withall, information that some have thought that the King is without a dazing. For their Law is the law of nature, not written but imprinted in their manners; and they are yet more gentle in punishments because they have the greater power; and although they seem somewhat in revenging private wrongs, yet further, they have the refractory and rebels to go unpunished, but wound and stab them with their stings. So delicate they are of peace, neither with their wills nor against, do they offer any annoyance. Who would not then utterly abhorre the Diomyian Tyrants in Sicily. Clearchus in Heraclea, Apollodorus the Caffandrian Robber? Who would not detest the villainy of those false Parasites to Kings who affirm that Monarchy is no other, but the means how to accomplish or satisfy the will, and how to maintain lust that which ought to be far from a virtuous Prince. Left while he would seem to be a man, he betray himself to be worse than their little winged beings.

As their manner of life is not pedantic or according to the vulgar fort, so neither is their birth. For the royal Race is not begotten a little worm at the first, as the Bees are, but presently able to fly. And if he chance to finde amongst his young ones any one that is a fool, unhandsome, hairy of an angry disposition, ill shaped, or naturally ill conditioned, by the unusumus content of the rest, he gives order to put him to death, lest his sordidery should be disordered, and his subjets being drawn into faction, should be destroyed. He sets down a way to the rest, gives order what they shall do some commands to fetch water, others to make honey-combs within, to build them up, and garnish them; others to go and get in provision: those that are strik'd in years he cherisheth at home, the younger he exercise in labour and victuall of employments; and although he himself hath immaturity from mechanick labour, yet as caufe shall require, he also refiteth not to work, nor ever doth he go abroad but for healths sake or necessity. He be by reason of age in health, he marches as General in the Vanguard of his Army, and in person opposeth himself to all encounters; neither is he born by his attendants willingly, unless it be when he is so old and diseased that he cannot either go or fly. When night comes on the signal being given by the Trumpeter, the common fort are commanded to their lodge and the watch being set, every one betakes himself to his rest, as long as the King lives, all the swarm enjoyeth peace, and all things are in quiet; for the Drones keep themselves willingly in their own cells, the elder Bees are content with their own places, and do not the younger run out of their own into the elders lodgings. The King lives apart from the rest in a more eminent and large palace, with a waxen fence curiously made, compassed about as it were with a kind of wall. A little way from him dwell the Kings children, to whom if their father or mother do but hold up the finger (as they say) they are hunte.
more dark, black and various coloured; you will condemn their skill when you observe their habit.

Their Kings in face and person differ, one
Bright, as it were with golden splendours dress'd,
And gorgeous glittering scales, to look upon,

The other's a foul, forlorn, dusty beast,
Staggy, large pannocks, unmeaning of the Train.

And thus far of the Kings and Nobility, now let us proceed to speak of the vulgar sort or Commonality of the Bees.

Bees are neither wild nor tame creatures, but a middle kind of nature between both, but of all in a manner the most serviceable and most profitable. Their flying both keeps them alive and kills them; for if that be once lost, they cannot live, but being armed therewith, they guard the Swarm from all hostile invasion. There are none of them idle; although all do not, have not the skill to make honey: neither do they which can do nothing at all, become like Drones; for they do not, as they do, spoil the comb, nor steal the honey. But they themselves are nourished by the flowers, and flying abroad with others feed together with them. Albeit also there are some amongst them have not the industry to make and store up honey, yet every one hath his work, and his art wherein he doth employ himself. Some bear water to the King, and to such of the Bees that are spent with old age, and are decrepit.

The more ancient and greater sort of Bees are chosen to be of the Kings Life-guard, or Esquire's of the Kings Body; if they be any way in health, as being of known trust, and well seen in the right ordering and managing of State affairs. Others of them administer Physick, and undertake to cure such as are sick; and of the Annise-flower, Saffron, and Violet, collect together, compound, and give them to drink, a most medicinable and cordial Honey. If any of them chance to die by reason of Age or sickness, forthwith the Bearers meet together, which carry forth the Corps on their shoulders as on a Bear, out of doors; lest they should any way pollute or defile their clean and near Hives with any uncleanliness, filth or putrefaction.

Neither are the Bees without their commanders, Captains, Lieutenants, Trained bands, Cornets, Trumpeters, Files, Scouristers, Watchmen, and Soldiers, an Army which do (as if it were a little City) guard and defend their Honey: and do in condign manner punish and torment the Dors that fly thither, and Worms that undermine them.

Left they should be taken for Drones, as they fly they make a buzzing or humming noise, which accordingly as they begin to fly or cease to hear or not heard; which found whether it proceed from their mouth, or from the motion of their wings, Aristus and Hesychius do much concern about. Neither was I ever so quick sighted, as to determine of a matter to exceeding intricate and obscure. But the Fives, and Cornets, seem to make that found or noise which Hesychius calls (ταυτό), the English call it flogging; and that they make their signal or watch-word when they are to watch, when to sleep, when to go to work.

So great is their care of preserving their King, that they suffer him not to go abroad alone, but gathering close together on both sides, their company being divided, they hem him in and guard him as he goes along. But if perchance in their journey the King shall wander out of the way, or shall be gone out of sight, being driven by violence of stormy weather, then all make search after him, and do follow him by the scent as it were, till they know certainly what is become of him. And if he be tired with flying, or disconsolate of weather, the company bearing him up with strength of their wings as it were in a Chariot convey him home. If he die, all of them go their ways; or if they chance to stay some time after, they make only combs, but no Honey; and within a while after, being altogether idle, full of diseases, starved, wallowing at last in their own filth, they miserably end their lives.

Without a King they cannot be, against whom they make not the least resistance, much less do they put him to death, unless as tyrants are wont he make his lust the rule of his Government, or being negligent of the Common-wealth, takes no care of it: yea if he use often to remove from place to place (which he cannot do without great detriment to his subjets) they do not for which kill him, only crop his wings; and if he amend his manners, and demean himself as he ought to do, afterwards they love and respect him as well as ever they did before.

The fly away and leave the Swarm, they fend him back again, and if he fly out of the Kingdom, they follow him; and finding him out by his scent as it were by a track (for above all the rest, the King or Miller Bee hath a very curious smell) they bring him back unto his Royal palace. Not a Bee whatsoever dares go out of doors to feed any where, unless the King or Miller Bee go out first and challenge his privilege of precedence. For I am scarce of Aristus agrees that the King never goes abroad except it be with the whole Swarm, which is a very rare thing. But when the Swarm by reason of the tyranny of their Prince are forced to remove to some other place, changing their foil and habitation, as unwilling to do, then they make an unwonted noise, as it might be of a trumper some dutes before, and two or three dutes before, a few of them hover up and down about the Hive. But when all things are ready for flight, away they fly all together, and if the Tyrant whom they left behind pursues and follow them they kill him.

Ggge 3
But a good King they never defert, and if he die by any infections, ficknede, treachery, or old age, the Nobles together with the common people lament and bewail him; neither do they afterwards go abroad at all, or fetch in any provision, but fill all their hosees with a sorrowful murmur, and thronging about the Corps make most tragical lamentation. After wards privately conveying him from the common multitude, they carry him out of the Hive, and make a most doleful cry about the place. Nor doth a day put a period to; or abate their sorrow, but they continue it to long, till by reason of grief and hunger they all die. Take the King or Matter-Bee, and you take all the Swarms if you misle of him all the rest convey themselves away and go to others. They cannot endure more Kings then one, the house of the usurpers they throw down and destroy their family. But if it be so that there be two Kings or Matter-Bees in one Swarm, (as sometimes it falls out) one part adheres to one King, and the other to the other; whence it comes to passe that in one Hive divers forms of combs are found: where they to behave themselves, that the one doth not encroach upon the others bounds, or invade his Territories.

And as for their Oeconomick or household virtues, they live Parasimony as the chief stay of their family; and having in the summer season gathered a sufficient flock, or store of honey, they do not profily lavish it, but sustain themselves with it in the winter, and that very sparingly; and to feeding themselves with a sparing diet, and that of the beast and purest food, they gain that as a reward of their sobriety, thereby to lengthen their lives, and prolong their daies. Neither are they so glibble or prodigiously parsimonious, but that when they finde that they have gathered more honey then will serve the number of their family, they do freely impart and communicate some portion thereof to the Dors or Drones.

These also are arguments of their cleanliness, that they never lay the excrements of their bodies (unless ficknede, extremity of weather, or meer necessity compel them) in their Hives; as also that as soon as any of them dye they presently carry them forth, and quit the Hive of them; no fea or putrid matter, no withering herb, no fading or trickling weed do they touch or come near. They never kill their enemy in the Hives, they drink nothing but the purest running water they can get, they will by no means remain or dwell in an unclean, filthy, nasty house or room. The ordure of those that labour, and of those that are tick within them, they lay upon a heap together without doors, and as soon as they have any leisure, he bearers carry it away.

Neither are they altogether impatient of musical sounds, as other ruder sorts of creatures are, but are very much taken and delighted therewith; provided it be without variety, smpfe and unaffected. And although they cannot dance by measure or according to the just number of paces, as the Elephant is said to do; yet according as he that tinks on the brazen kettle, pleaseth, so they slack or quicken their flying; if he beat fast and swiftly, then they mend their motion, if dully and slowly, then they abate it. Neither hath nature only made them the most ingenious of all other creatures; but very tame, and tractable by discipline and education to the keeper of them; for they are all at both his beck and his call, and whatsoever he pleaseth to do none of them gainay or forbid. If he beat them, they complain not, and if he rob them and spoyle their combs, they make not the least murmuring, or shew the least discontent. Who would not say this were an argument of a most noble and generous disposition, to o ffer the rigid commands of their keeper; and yet by no means to obey of subject themselves unto the discipline of any stranger whatsoever?

It is wonderful what some do observe as touching the temperance and chastity of them; for whereas all other beasts, the Elephant only excepted, do couple in open view; and the Wasps not much differing in kind from them do the like, the Bee is never seen to generate openly, but either doth it within doors with modesty, or without when none shall be by to observe it.

Neither, as the report goes of them, are they leele valourous then they are chaste or temperate.

Whilst they expose their bodies in the war, And nobly die, receiving many a shot.

Their war is either insipte or civil, or foreign and with strangers. Of their Civil wars there are divers causes, as the multitude of the nobility treacherous to King and State, death of victuals, narrowness of place, when they are not able to live by one another; as also corruption of manners, and flaggishnede. Now if they superabound in Nobility (as sometimes it falls out) they put to death so many of them as seem to be superfluous; left their number still increasing they should force and over-power the King himself, or entice the common people into sedition. But they destroy them then chiefly when they have but a small issue, and have not where else to betiffow, those together with their combs (if at least they have gotten any) they throw down, and pluck to pieces. The Dors alio and Drones they kill, as often as they want room for their works (for they take up the innermost part of the Hive) and take away from them both their honey and their victuals. As alio when their honey fails, and there is a dearth, then they go to pull mells amongst themselves, and fight as it were for life and blood: the short Bees they fall upon long, the smaller sort set upon the Drones (as idle and unprofitable) with all their
Chap. II.

Of lesser living Creatures.

their skill and force they can use. In which conflict it do come to pass that the Short Bees have the better, they will prove an excellent Swarms; but if fortune give the longer the day, they will live ever after idly, and make no honey worth any thing. But that tale which overcomes is so mightily bent upon rapine and revenge, that it puts all to the sword, yielding no quarter or truce at all.

As concerning their war with foreign Enemies, there is no creature under heaven so bold and adventurous as they are, infomuch, that whatsoever, whether man or beast, or bird, or warp Inall molest them, yet and seek to destroy them, they sharply set themselves against, and accordingly as they are able wound them with their stings. Unleas persons or any that use sweet oils or perfumes about them, or those that wore culed or muffled locks, or red clothes (as resembling the colour of blood) they cannot in any wise endure; as also all base and vile companions. Whereas on the contrary their matters, keepers, governors, and thoes that make much of them they do most dearly love and affect; and sitting upon their hands in stead of slinging them, they seem rather to tickle, and as it were by way of sport to tick them without any the least harm at all. Yet they may have free leave when they are uncovered in the heat of summer, to gather their Swarms with their bare hands, to handle them, to dispose of them at pleasure, to toll them to and fro, or stand before the Hives mouth, and here and there to drive away the Dors, Drones, Wasps and Hornets with a wand. But if any of them have lost their sting in skirmishing, as a foullder having his arms taken from him, he is quite disheartened, and living not long after dies with grief.

When they go forth to battle, and are ready to give the onset, they hurry while the signal is given, and then they surround their King (if he be one they love) and in one battle determine the quarrel. But in the fight, what wonderful valour, strength and courage those little beasts do shew; both I myself have seen and know; but they far better who report that whole fields of armed men, have been conquered by the stinging of them, and Lions, and Bears and Horses flain with them. But yet (as fierce and warlike as the are) by daily converse with them they become tame; and unlese they be provoked they live very quietly, so that any man may stand before their Hives, if he not on purpose to disturb them, and they never offer to hurt him.

But if we should go about to set forth at large their ingenious disposition, cunning workmanship, industry and memory, we should not with Virgil the Poet yeild them only to be endured with a small portion of divine inspirations but even wholly to be proflett with a rational soul, and to one with Pythagoras to have the understanding of the most ingenious man infued into them by a μαρτυρίαν.

Foras soon as they are lodged in a clean and sweet Hive, they gather from those plants that diffil moisture and yeild Nature, (as from the Willow, Elm, and Reed) and even from horses themselves, a kind of Glue very thick and clammy, and with that (which the Latins call Commifus, the Greeks χάλας) they lay the first foundation of their work, and dawb it all over as with the first platter or rough-calf, the which afterwards they cover over again with a kind of wax moist with rofin and gum, last of all with Bee-glew. When this triple wall is artificially finished, they do not only deceive the most curious and unreet observer of theirs, but without any man taking notice, they do better and better arm and fence themselves against wind and weather, vertene, and all their enemies whatsoever. When this is done they frame their Honey combs with that skillful Architecture, as that they may seem to put down Arhitectus himself in his own Art. For first of all they build the cells of the King and Nobility in the upper or more eminent part of the comb, large, fair and fared, wrought with the most pure wax of all; which allo the better to secure and defend the Kings persons, they compose round about as it were with a certain fence or wall. And as their Bees are of a thousand sort or condition, so they make a thousand division of their cells. Those that are aged and sticken in years (being to be as counsellors of State, and inquircs of the Body) have their lodgings near the Kings Court; next of all to them, those of the first year, or young fry, those of ripere age, and lusty in body they place utmost of all, as those that should be able to fight for their Kings and the royal Hive. Notwithstanding Ari-fater writes that they first provide cells for themselves and their issue, afterwards for their Kings, and last of all for the Drones. And as in the making of their combs, they fashion them according to the largeness, and figure of the place; and those either round, or long, or square, or according as they please, and sometimes eight foot in length; so on the contrary their cells are tryed to a strict Geometrical form exactly, to wit, Sextangular, or with six corners, only just fit and no more for the bulk of the inhabitant.

But those cells where they make their Honey, and those which are for necessities for their young ones, are double from one side of the Honey comb to the other, separated one from the other with a thin partition o moud.

Those Figures whereby the Combs are fastened to the side of the Hives, are more frightful and are empty of honey, being allo much more firm and strong, that they may the better bear the rest of the weight which depends upon them. Those Combs likewise with which they cover the pluffer moul with waxe in those they use to flow a greater quantity of Honey, as in a more safe and secure repository.

Now the whole Honey Comb contains four ranks or divisions of cells, the first the Bees take up the next the Drones, the third the Gentles, and the fourth and last is set apart for a Porsauce for Honey.
There are that affirm that the Drones do make Combs in the same Hive with the Bees, but cannot make any Honey at all; whether it be by reason of unwieldiness, or corpulency of their bodies, or their natural inbred lillothis uncertain. But if their Combs begin by reason of the weight of the Honey to flog or to be ready to fall, they raise them up and under-prop them with arched Pilars; that they may go under them, for to every Comb there must of necessity be a ready passage, and whereby they may execute their several offices which are appointed them. In some places as in Pentas and the City Asinums, they make white Honey in trees without any Hives at all. But as for the others in making their Combs they beyond all humane Art, who would not acknowledge for truths, that of the Poets,

That the Bee hath in it a particle of divine understanding, and heavenly wisdom? Who I say will deny them to have fantastic, memory, and some kind of reason? But I will not argue the truth of this, neither will I affirm with Pythagoras, that the souls of other wise and ingenious creatures, or of men, do pass from them into the Bees. But yet notwithstanding he that shall hastily weigh and observe how they give out to every one his several task, some to make Combs, others to gather Honey, dresse up their rooms, cleanse their layfaltis, to prop up and repair their ruined houses, to cover their boxes, to draw out the spirit of the Honey, to conceal it, to bring it to their cells, to serve those that are at work with water, to give food at certain set hours to those that are bed-ridden, feeble, and aged, with so great care to defend their King or Matter-Bees, to drive away Spiders and all other their invaders or annoyers; to rid their Hives of their dead, (left their work should be marred with flesch or putrefaction) to be able every one to return to his particular cell: in a word, to seek their living as near home as they may; when they have sucked dry the neighbouring herbs or flowers, then to send out spies to see for pasture farther off, upon any night design or expedition, to lie under the leaves of the trees left their wings being wet with the dew, their speed home the next day should be hindered; in boisterous weather, to posse or ballance their light bodies with a little stone taken up into their mouths, and when the wind blowes hard, to recover the windy side of the hedge to shelter themselves; and the like: firstly he will confesse of his own accord that their Common-wealth is wonderful well ordered, and that there is very great discretion and understanding in them.

I had almost let passe that natural προσωπον, or affection, that great confiance seldom seen in Parents of this Age, wherewith they care for their young ones; in the Hive where they have led them they fit upon them as birds do, and never go abroad unless enforced with extreme hunger; and when they do, they presently return in again, as if they were afraid left the Spider if they tarried long (which many times happen) should cover the mouth of the cell with his web, or their little ones being benum'd with cold should be in danger to be starved. But yet neither are their children delicate, or nicely brought up, for at three days end (asoon as they have any wings) they let them to work, and have a strict care that they loyter not, or take a haunt of Idlenesse.

So much foreknowledge likewise have they, that they can precipitate rains or cold weather to come. And then (by instinct of nature) they never go far abroad, but hover about their stocks or Hives, and fit upon them as upon flowers. When they go forth to pasture (which is not at set times, but only when it is fair weather) then they labour and toyle so hard, and so lade themselves with Honey, that oftentimes through weariness they cease in their journey, being not able to reach home; and whereas some of them by reason of roughness and hairiness become unapt for labour, then they rub themselves against rugged stones or the like, till they be smooth again, and so buckle to their work at last as hard as they can drive.

The youth or middle aged Bees are employed abroad and bring home those things which the King or Matter-Bees gives them in charge; the elder sort take care of the family at home; and do order and dispose of the Honey which the middle aged Bees gather and make abroad. In the morning they are all still and silent till such time as the Matter-Beec gives three hums and raiseth them up, and then every one makes halfe out to his several employment. In the evening when they return home, they at the first make a great noyse and tumult, and within a while afterward by little and little caufe, till at length the Captain of the watch flies about and makes a buzzings, as it were commanding them to their rest; after which signal given, they are all so hush'd and still that if you lay your ear to the Hives mouth you cannot perceive the least noisie they make; fo subject are they to their rulers and governors, and at their beck and nod are presentlie quach't.
Of the Creation, Generation, and Propagation of Bees.

Of the first Generation of Bees Aristole hath a long discourse. The Philosophers following him have rightly determined in my opinion, that their Generation doth proceed from the corruption of some other body: as of a Bull, Ox, Cow, Calf, very excellent and profitable beasts; the which, not only worthy men, and without all exception so report: but even naturalists, and common experience doth confirm. They say that out of the brains of these beasts are bred the Kings and Nobility, and of their flesh the common sort of ordinary Bees. There are likewise Kings that are bred out of the marrow of the chine-bone, but then those that come of the brains do far exceed the other in feature or comeliness, in largeness; in piulence, and in strength of body. Now the first transformation of this kind into these Creatures as it were by a kind of conception you shall then perceive to be as in shole little imperfect creatures appear in great numbers about the Ox, Lion, &c., in a small white hollow, and as yet without motion, but increasing by degrees, and their wings by little and little growing out, they come to their proper colour, flying to and hovering about these King or Matter-Bees; but yet with short wings and trembling as unaccustomed to flight, and by reason of the weakness of their limbs. Now what counties do most conduct to the generation of Bees, and what are most suitable to them, we shall afterwards handle when we come to treat of Honey. In general there are very few places in the world to be found (unless it be in a very barren country, and unwholesome air, and where no food or for them can be had) in which Bees cannot breed and very well live. But where there is perpetual soil and snow (as in Scania) or where the country is barren of herbs and trees, (as in Thule) there they are neither able to breed nor live. As also for the poisonous condition of the air and nature of the soil some sort of Bees do not endure to live there, as in the Isle of Myrora it is reported, that if Bees be carried thither (it is said) they will believe them perfectly dye. But whereas Mynster, which of Ireland, and Salamis of Great Britain, that those Countreys are altogether without, and that they cannot live there, if they had not spake rather by hearsay, then of their own knowledge, they would have written that every village or town almost is full of them. And thus much may suffice to have spoken of the Generation of Bees, come we now to their Propagation; concerning which Authors have divers opinions.

Some say they never couple or bring forth, because no man ever yet saw or could tell whether they did so or no. Others say, that when they have fed their seed upon the flowers or leaves of trees, they carry it to their Hives by diligent and soft setting upon it, it comes to perfection. Pliny will have it gathered from the Flowers of the Honey-suckle, or Honey-wort. Aristole from the flower Calander, or called; Atheneum of the Reed-flower, some of the flower or berry of the Olive; taking that for an argument, that in those years wherein these flowers are most plentiful, there are great numbers of swarmers of Bees; but when there is scarcity, then few or none are to be seen: when as yet they do not consider or observe that even in very cold countries where none of these flowers grow, nor are so much as seen, there are plenty of Bees. Iam of opinion that they are propagated by copulation, and I am confident the male Bee is the greater; the female the lesser, who whether as Cocks do read their Hens, so they accordingly engender; let experience teach: yet certain it is, that the lesser Bees only, to wit, the females do sit upon the eggs, and the shells being broken (after the manner of Hens) they do by an admirable and natural midwifery put forth their young.

Aristole on the contrary affirms, that the Kings or Matter-Bees themselves do first bring forth, and afterwards all the rest, as those also do the Drones, but the Drones beget nothing, and so their generation ceases. And this it may be, without some reason, in regard that the Kings or Matter-Bees always remain within, as if they were ordained by nature only for propagation, neither ever appear abroad but when together with the whole Swarm they go to some other place to dwell. For the same reason also they are so extremely beloved of all the Bees, and live exempted from all necessary business and labour. These do also excelle the other Bees both in bulk of body and strength, as if their bodies were by nature made only for their Bees. But the great Drones keep a mean between both, and hold such a livery, and concordance with the Labouring Bees, as that they may nourish both the Drones their Nephews, and the Kings their Parents. But after this, the Philosopher adds, that Bees do not engender by way of copulation, because their young is so small; the same argument may be held of the Flies, of which some are bigger than Bees, who lay little worms, the which growing by little and little become like Bees without wings, and afterwards become Flies.
Others there are who think that Bees do spring from the Honey, or with the Honey; or at least of the moit pure and excellent part of it: and that without all purefation. But yet something whatever it be, serving to engender, and out of which Bees are engendred, without doubt is laid in the cells.

Scaliger thinks they lay Eggs, although the Bee-masters, with one consent, say that they lay little Worms, not Eggs.

Tasius is of opinion, that they do couple, and determines the Bees to be the males, the Kings the females; and that the Kings at a certain time do put forth little Worms all about the Hives, as the Flies do, and the Drones for upon them as the Serpent with to do, and by latching upon them for such a time doth cherish them. Then afterwards these little Worms called in Greek ἔχθραι, are fed with the petre, as it were with a mixture of wine and honey together, till at length they grow to be Nymphs, i.e. little Bees; but without wings; and then being wrapped up like to Anđeloi, they lye still in the cells, neither taking any food or making any excrement. Till at length by such a day the shell wherein they lay being broken-out come the Bees; and addrelle themselves to their several employments, their wings being not yet fully grown. All this time the Bees are much delighted with wine, especially of men, and therefore do frequent those places which are wet with it, but especially after rain.

To the CONSERVATION or keeping of Bees; many things are required, to wit, orderly diet, drink, sleep, watching, air, exercitation, habitation, convenience of place, as also moderation of minde, and phyfick fit to cure their Difcafe; of which we shall speak in particular. As touching their provision, they seek for nothing, but they themselves being mindful of the approaching winter, they take pains for in summer; and what they get store up accordingly. For they gather and cook or dribble their diet themselves, the prime or chief whereof is Honey, which being over nearly drawn from them, they become gusty, and lank, and transparent, that you may see through their bodies; and unleafe there be other means made to furnish their hunger, they all dye for want of food. They have also other meat to preserve themselves withal, as War-wort, Honey-wort, Bees-meat called Sandarac; but this is the worst, and rattle sweet like a fig: when their fail, the Bee-masters lay before their doors, figs, fugar, dried raisins, the drones brusted, the heads of gentilies, wool wet in fow or sweet wine, and also honey-water, left they should faint and dye for hunger.

Pliny would have raw flesh, if it be sweet and fresh, to be laid for them to feed upon. Generally all sweet things and of pleasant smell they cover, though at a great distance, not so much for the finnesakes but as being their natural food; as Flies feed upon wine. No odoriferous and fragrant flowers do they refuse; from whence they are in the Latine called Flôrîce, in the Greek Ἅρπανα, Ἀσβίλία, from the delight they take in them and their greediness in gathering them.

The Plants most acceptable to Bees, are the white and red Thyme, Melicor, the Myrtle, the Willow, the Broom, Lavandes, Beans, wide Thyme, Violets, Keses, Rosendyl, sweet Flæsband, Almonds, Heath, the Tamarisk, the Cytisus, Caia, Daffodil, Alphodil, but chiefly Balm: concerning which Maister fang their matcillent verses:

That herb the Grecians call Balm, the Bees approve,
And above other plants do highly love;
No flower or plant doth please them half so much.

Afto the Jvy, black Hellebore, Origandu, Savoury, wide Violet, sweet Marjoram, the Hyancynth, the Palm-tree, the wide Olive-tree, the Flower-de-luces, Saffron, Rose, Lilly, the Ju-niper-tree, Pear-tree, Peach-tree, Turpentine, Maffick, Cedar, Tiel-tree, the smaller Oak, goldylocks, wide Saffron, Camilla, flowers of Mutard, French Spondilium, Crowfoot, purging Thorn, all trees that bear Malt, Apple-trees which have no bitterness in their blossoms: moreover they feed greedily on the flowers of dead Netfles both white and yellow, whereupon this herb by the Helvetians is called (Bienfuge) as if you would say, fucked by Bees.

As for their drink, if there be but a river or running water hard by in which there are stones, or pieces of wood (upon which they may light conveniently, and bath or wash themselves) they go no farther to drink, if there be none, they fetch their draught other where and quench their thirst, and when they have done, they carry of the fame liquor to their King or Master-Bee, and to thofe that are at work within (as hath been said before).

Whatsoever they eat or drink, must be undefiled, pure, sweet, and without any fench or purfation whatsoever.

Yes, so cleanly do they live, that if a menfianous woman come near them; they are reported to forake their food and feed no longer, as alfo thofe that are sweet oyls or perfumes about their bodies, and thofe that are given to overmuch lechery they hate above measure; and can by no means endure: alfo all things that smell of oyl or smoke, and dunt and dust, they are very fliche of coming near, nor will they touch any thing that favours of any fuch matter. All hurtful herbs, all that have any bitter, purgative, unpleasant or poyonous quality in them; they to bear Wormwood, Rhabar, Senna, Svin, Tithymals, Hellebore, Wood-azure, Coccus gmian, etc., etc.
Chap. III.
Of lesser living Creatures.

Dius, Thaphia,indle Cucumers, Yeew, Rhododendros, Wolfs-bane; they will not once taste of.

When they have laboured hard all the day, and come home weary, a certain signal or token being given, (as is above mentioned) they take their rest. The which oftentimes is many wiles disturbed and hindered, and by this means the Swarm being almonified and over wak'd do die; sometimes the Gad-bee or Horse-fly molest them; sometimes the Bear making a noise wakes them, sometimes the approach of the enemy affrighteth them; viz. the Lizzard, Spider, or the land Toad; in which regard the Comet presently founds an alarm, and calls them all forth to arms in the night. If it happen to thunder or lighten by night, they are all presently in an uproar or tumult as if there should be a mutiny in the Army, or some fatal battel to be fought. And the reason of it is, in regard of the unwonted noise of the light at such a time, as also because they are strait, and that not without cause, lest their Hives being shaken, the combs should be disordered and displaced, or their little waxen vessels being melted, the Honey should run out. That this is true by experience, no man can better speak than Dr. Penny and my self, who in the moneth of Aug 1586, whilest we face up and watched by the Coun- trell of Somerfl they a widow lying dangerously sick, together with her two noble Daughters Mary and Elizabeth, a sudden (after a great clap of Thunder) under the next ceiling between the joyful, we heard a great noise, as it had been an alarm of war, and as we thought the floor did refuld with the noise; being altogether ignorant of that (which indeed was the matter) that Bees did harbour between the rafters and the ceiling; where it seems they had remained for 30 years altogether, and every year to have yielded two or three Swarms, as we understood after-wards by those which were eye witnesles of the same; and they of the chief Nobility, who affirmed it to be certain. The next day for want of sleep they flew about making a hoarse noise, trembling, and not knowing what they did; they did touch those things which naturally they could not endure, they did despatch themselves poor creatures against the windows, they did not spare to sting their friends and those that looked to them, even to the admiration of all that stood by and observed them. From whence we conclude without all doubt, that Bees are most patient of labour in the day time, but most impatient of being fared in the night, and of being disturbed of their rest.

From whence they seem to have gaine the name or Epithet of Soliagens, or Sun-followers; for with it they rise, and with it they rest, None of them take so much as a wink of sleep all the day long, and all of them in the night sleep very soundly.

Now their exercise is of two sorts, either they fly abroad for their pleasure, or carry at home and work for necessity. If that be denied them (the Crocodile, Swallow, Lizard, Spider, or other strange Bees intersecting them) either by reason of temperate weather, or long rain they become putref, unwieldy and numbed in their limbs, grow into disesies; and shortly after die, especially in the summer season, which is the only time they have to exercise themselves abroad in the open air. When they have refethed themselves with flying about; then they bath and wash themselves clean; and after wards they lightly rub themselves smooth with leaves. Moreover also sometimes they carry little stones, sometimes they carry water, and as little things as they are, will break through the wind though it fly against them; and they will in a bravado, yet they will venure their very lives also to fight with the greatest of beasts; Horses, Elephants, Dogs, yet and Men too (Arbileclus was of this opinion) if they offend them and quarrel with them they wound, and with their bums often and fiercely thrust into their bodies, they kill them. Sometimes they appoint duels one with another, not in earnest, but in jest, for exercise and recreation, nor with any intent to hurt one another. They will play together oftentimes, and tickle one another, and like Doves bill and kis each other; after which without doubt they couple together also, but at what time after, in what place, after what manner, let that all-eyed Argus rell, who alone fars by the Elephants and knowles when they engender, which no man ever saw but God.

Now as they perform the aforesaid exercises of flying, of pincing, of carrying of theses c. for their recreation, so necessary the mirth and tole of Arss hath inured them to domestick labour, to which they diligently, not lazily apply themselves, no day (if the weather let nor) is spent idly; but how long they work, that wholly depends upon the constitution of the Climate, or the air. For in cold Countries from the setting of the Pleiades or seven-stars, to the Vernal or Spring Equinoctial (or thereabout) they keep close within their Hives; but like Dormice without food, sleeping, and so they continue rouled up together like a ball, in a heap; nor do they flit a jot from the place where they are: for else how should such little creatures as they, be able to endure frost and snow, and the bleak gusts of the north wind? But if the temper of the year be more warm, and so continue for a great while together, 'tis longer ere they leave their works, and that Eebia proves by manifest experience, where through continual heat, and almost no cold that is there, the Bees work almost all the year long.

But in Europe they seldom go abroad before the beans begin to bloom or blosson, (as Pliny witnesseth) which they take of the first of all flowers or herbes whatsoever. Servius dreams that when winter drawes on, they flop their mouths with juice and flowers, and with these keeping in their Hive to fatten themselves. But in summer they never loyster at all, but exercise themselves in constant employment; and when they have gotten such a nuscent or off-spring that one house
house will not hold them, in the month of May they make a tolem expedition, and divide themselves into several Swarms hanging upon the boughs of trees like bunches of Grapes. The elder Bees afterwards making two or three rounds or circles in the air go to their food and return to their Hives: the young swarm or colony thus sent forth and left, unless they be entertain’d with fresh Hives, wander up and down the woods, until the publick overseers and hospitable Bees have found a fit place for the Swarm to settle in.

Now having spoken of their exercit, in the next place let us enter upon the description of the places or houses where they are to reside, which the Greeks call μνηστήρ, μνηστήριον, &c. The Latins, Alveus, Alveus, Alvearium, &c.

Now about the for the conservation of the Bees, three things are requisite or needfull. The fashion of form, preparation, position, and the fitnesse of the place where they are to be set. The belt receptacles for them, are made with bars, but especially with sticks which in the heat of Summer doth not scorche them; and in the Winter is very good to keep out the cold. The Ancients were wont to make them of an hollow tree, or of boards artificially joined together, also they were used to be very handomely made of Reeds, or of the Holm-tree wetherd or twistd together. Those of each are conned the world of all, as also those that are made of Brick, or Clay, because in Summer they are over hot, and in Winter as extreme cold. And yet (as I hear) in Hungary they have certain thick pots or vellts to hang up from the ground and there they hang up in Trees, for the Bees to make their Combs in; which when they have done, they at a certain time take away again. Some make them of Mud or dirt, but these likewise have their inconvenience and discommodities.

The English use to enclose them in Hives artificially wrought and built of straw; that in Winter they should not be harved, nor in the Summer wittered with heat. The Ancients were wont to make them of a kinde of transparent Stone, of Horn, and Glass, to the intent that they might look in upon them and fee how they wrought. But the Bees lay a fift, second, and third covering over their work within side (as I said before) whence they perceived they loyd their coft and labour in that contrivance, as being never the next by that way to gain their purpose.

Let the form of the Hives beafter the manner of an Egg, the yolk and the white being clean taken out, as when we eat it, a little of the end being pared off.

Moreover the Hives ought to consist of twelve rounds or wreaths of straw woven together after this manner:

The first lowermost must be of one size or bignesse, a foot and a half in breadth: The next above them are to be a little bigger and more capacious, that the combs may be the better fatterned, and may hang more freely: The other 5 circles or rounds are to be narrowed and made steep up to the top by degrees, in the like manner of a fquare or pyramide; but the whole Hive ought to be of that consist and bignesse that it may contain in it all about 20 l. weight. Let the mouths or pallets into the Hives (by which the Bees are to go out and in) be about three or four, and no bigger than that the Bees when laden with Honey may well go in; for by this means, the Lizards, or Beetle, venemous Spiders Moths, using to rob their Hives, are barred of their entrance; and the Hive will not be so obnoxious to frost, and the extremities of the winter season. Above these they use to make 4 doors to open the windows to let down with bolts, 2 in front, and 2 behinds, that they may the better take out the Combis, with leffe difturbance to the Bees in their making Honey.

The preparation or setting of the Hive after it is made, is reported to be divers. The English do take in new Swarms into new Hives, without pensioning or anointing them at all. The Ancients after they had made them very clean, did use to rub them all over with Balm, Thyme, Fennel; and did sprinkle them with some sweet thing made of honey sugred, or with sweet wine or meleghins that so they might the more willingly come into them, and the longer remain in them. Palladius was wont to anoint the inside of the Hive with the dung of the fift calf that the Cow hath; and this he accounted for a chief securt to retain Bees in the Hive. Moreover it is requisite that about the midst of the Hive there should three or four ficks be laid a croffe to hold up the Combis; and then they are not tincted with any light flaking of them to fall down; and are more easily if need be, taken away. Take heed also there be no chinks ortisins in them, whereby they may be annoyed with heat, cold, dust, vennine, the Cankerworm.

As for the Placing or setting of the Bees, it is convenient that the Hive should be mounted on forms or stands, that the be not dirty or moulty with standing on the ground; and that they may live more secure from noxious and hurtful beasts. Let their flandings be made of stones, chalk, elm, or oak; three foot high, covered over with flat tiles, or pargeting, or whirlines, and that very smooth and feel not that which Honey and Bee-devouring creatures may not be able to climb up. Let them also be well fencing or falling forwards, left the rain-water leaft upon them should soak and weare into their Hives: for which cause (as Cimonella winewether) they were wont to be placed in hollowed walls or poiches of Cities. Let there be two hands distance between every Hive; that one flappdng or flaking the next may not be troubled, as it is usual when they are set close together.

Now as for their Ranks or rows how many they should be; they are not to be above three at
at the most; of which, let the younger Bees have the first, the second son or middle-aged, the middlemost, and the elder Bees, the highest or uppermost place. But yet both the Hives and the forms whence they are fet must be conveniently placed for the benefit and advantage of the Swarm; in hot Countries, towards the North; in cold, towards the South; yet in Abi-
idna under Prefer John, the Bees live in the Tradefmen houfes, and flying up and down amongst them without fear, hang up their Combs, their hives being made faic to the beams or joyces of the fame, without any harm at all to thole that work in the place. Moreover in many places in England they have been known to have taken up their harbour of their own accord, and that for a long time together between the rafters and the ceiling of houses, and in the hollow trunks of trees, and from thence the old Bees have fent forth three or four SWarms of young ones in one year. And (what is worthy to be noted) they live here longer and more happily, than in their artificial woven Hives, with fo great diligence perfaimed, fo curiously set, ordered, diglized and placed. But yet I commend their industry who have freed the Bees from this trouble, and have no leffe ingeniously built them houfes to keep them from wind and weather. But they above all the reitdefere Commendation who have found out how to cure the difeafes of their bodies and minde, inward and outward, and have had the skill how to apply them accordingly. The palions or diletempers of their mindes with which they are moft troubled, are Anger, Grief, and Fear. For they very hardly digest Injuries, and they betray a great deal of choler and spleen to be in them, by their often fighting, even amongst themselves. For if they over abound with illnes, they are all in an uproar about their cells and lodgings, nor can the Quarter be composed, till many are slain on either party; or being divided into factions, they do of their own accord seek other places of habitation. More then this even thefoundiers of the fame Colony, when they (for some private grudge or jealoufie fall into a rage) they make war, and fall foul one upon the other, the which the wary Beemaster clipping, and cufing in duft or cold water by fquirits in the vent holes, where they go in and out, or making a terrible and hoarfe noise with the palms of his hands, doth before it be too late pacific. For if he should let them fight on, they would be fo mad and cruel one againlit the others, that they would never be quiet till they were all killed.

Sedbe and Melancholy also doth very much dillemper and disturb them, arising sometimes from the death of the King or Mutter Bee, sometime of their young ones, sometime of their keeper; neither will a day ceafee their conceived fowor, but they take it to heart, that their bodies pine away, and it confines them to skin and bone. Neither will the tingling or tinkling of the bratfe pan, or any harmony whatsoever delight them (which yet when they are mad, and dore so that they know not what they do, is wont to cure them) there is no plague or difeafe that can be named, that is more deadly to them than this.

They molt find in fear of the Spider, Lizard, Crocodile, Toad, Glow-worm, Gad-bee, Waft Hornet, the multitude of Dors or Drones, a little bird called a Houp, the Titmoufe, Swallow, the Woodpecker or Ear-bee, the Owle, and other the like destroyers and spoilers of the Hives. They are likewise very fearful of an Eecho, thunder and lightning, and the like sudden cracking noise; as on the contrary with a folt still whiffling, or murmuring noise; and tinkling of bratfe they are exceedingly taken and delighted. When fear takes hold on them, poor creatures, they wander up and down they know not whither, and when they go our in to their Hives, they seem to be giddy, as if they had a Vertigo in their brains whirling and turning round; as for their Honey, or their young ones, or for thole that are fick, they scarce regard them; and never leave trembling and quaking in their wings and flanks. The Bee-master therefore (when their provision fails) ought to destroy the Drones, and by putting raw flech into a pot to take the Hornets, and then burn them. To kill the Frogs, Butterflies, Wood-worms, and Canker-worms, to wipe away their webs, to entrap the Gnats and Flies, to flay through the Lizard, Crocodile, black fly or Bee-cle, and by putting in a Candle (to which they will come of their own accord) to burn the Glow-worms or Moths; to chafe the Frogs and hunt them from the standing waters and fenny places to throw down all the neits of Swallows, Middwals, Owle, or Woodpeckers (especially in all the neighbourhood or places hard by them) to destroy the Muskin or Titmoufe; and to defend them against all other beams that he in wait for them and all other strange Swarmes: In which fight
The Bees do as it were acknowledge their keeper, who after the victory ensuing, set upon the vanquished troops, but to their defender or champion offer not the least harm.

The Bees by their means thus quelled of their fears, only with the tinkling of the Pan, and sometimes with the Bee-masters voice only, are strengthened and brought to themselves again, and every one cheerfully returns to his several appointed employment as before. Some Bees also are caught wandering up and down, and flying away from their Hives, for they take pleasure in wandering delights and embraces, and never care at all for coming home to their own habitations: this ill habit and haunt, the Bee-masters with clapping of their hands, and with the found of the bralle (in which Bees are said extremely to delight) do presently remedy; although it is yet uncertain whether they do hear the sounds and are led by the pleasure of it; or whether or no rather being affrighted and terrified with the trembling and reverberation of the air (as when it thunders) they return to their Hives; and I see no reason why Phiny and Niphus should here make a doubt. Others left the swarm should fly away and so be gone, do crop off half the wings of the King or Master-Bee. As also others do beat near or dawb the vent holes out of which they come, with the dung of a calf newly calved. Moreover if you set their pillages with the leaves of the Olive-tree boyled, they will not depart: also Wine and water is very good, but above all, the juice of the herb Balm wherewith (as it were with a kind of philtre or love-potion) they are most powerfully retained, as the Poet Maureris.

Phiny faith, if some of the dust over which the serpent hath gone, be cast upon the Bees, they will return to their Hives. Others yet advise to sow Goldlocks near where they are, as if they delighted most in that flower above all others, and would never forsake those places where their flowers abound, and Authors report that the wilde Bee is allure and tamed therewith.

The bodies of Bees likewise are subject to divers diseases, viz. repletion, inanimation, growth, moistness, cold, and unnatural heat. Repletion, or abounding of humours is cautious when the Bee-master néglècts to gather the Honey in good time; for then they do fill and gorge themselves, till being grown over with fat and scurf, and fowl in their throats, they become sickly; there follows upon these flagelliflæse, fevers, longings, loathing of their food, watching or wakefulness; with which the miserable poor owen Bees, uniflee they have some timely remedy, do die; wherefore of necessity they must have their Honey gathered from them. In dong of which two things are to be observed, viz. the time when, and the quantity how much, the which according to the quality and custom of Countreys, are divers. For in England they gather the Honey every year, viz. either in the latter end of July or in the beginning of August. In hotter Countreys they observe three times in the year to gather in this Honey harvest, viz. at the rising of the Pleiades, when their are at they Zenith or Vertical point, and presently after their setting. Didymus in his Geoponicks, writes that this time of the Pleiades is the best. The Romans did use to unbowel their Hives, the full time in the month of May, and then again when Summer was almost done, and thirdly about the Ides of October. From whence it was called Spring Honey, Summer Honey, Autumnal Honey, or Honey gathered in Autumn. Aristofene adieth the first taking Honey, to be when the wide Fig-tree begins to be green; the second he commends to be done about Autumn. Generally it is very necessary that the Honey should be taken when the Hives do over abound with Honey; the which is certainly understood by the shrill or squeaking noise that the Bees make. For if they be empty, they give out a more clear and loud found, as being more full of air then men: but most certainly it is known by looking in at those doors placed on both sides of the Hive, being open (faith Columella) of which we have made mention before in the building or structure of the Hives.

The manner of taking them is thus; Betimes in the morning while they are half asleep and drowsie, is the time the work is to be affected, and their Combs taken away; it being not convenient to exasperate them in the heat of the day. Columella prefers for this use two Iron instruments of a foot and an half long and somewhat longer; the one must be a long knife with a broad edge on both sides, but dull, with a crooked head and sharp teeth to take out the Combs withal, the other plain with two sharp edges, to cut down the Combs. With these the vessel being opened, the honeycomb will very well be effected. In England as also in other Countreys in Helvetia, Germany, and the Low Countreys, they do not set upon them with these iron instruments, but with fire and fumes, and water, with which they chase the elder Bees from Hive to Hive and keep the Swarms entire at their pleasure.

Moreover in taking away the Combs, there ought a mean to be observed, according to the greatness of the Swarm and number of Bees. For with overmuch plenty of Honey they grow idle, and both defraud their Masters and themselves; for when the abounds with Honey, they feed not on Bee-breads, but glut themselves with the very purest of the Honey: on the other side if there be not enough Honey left them to feed on, languishing for want of sustenance, they grow heartflee, and live carelessly, and becoming so thin that you may see through them, being starved and feeble, they miserably perish.
Moreover, the old and rotten Combs ought to be taken away (but not those wherein po
terity is concerned), and those which are whole and which contain the young spaw or fly of the
Bees, unless you see that there is not so much Honey left as may serve for the satisfaction
of the Parents or elder Bees. Keep such a proportion, that in the abundance of Honey you
take two parts and leave a third; if there be but indifferent stores, take the half; if the Combs be
in a manner empty, take nothing at all out of them. But this proportion is not to be observed
in all places, because in regard of multitude of flowers, hope of pasture, and goodness of the
air, together with the condition of the Country, you may take away more or less as you shall see
suit. For in Ethiopia, Syria, and edftrina, they commonly take all the Honey out of Hives:
which by reason of the barrenness of the pasture, and continual dews, are filled again in very
few days.

But if there chance to be famine, and scarcity, you must not only depriv the Hives, but take
away part of the Bees also; and chose the greater part of them, with the smoke of Tows, Reed,
Turpentine, or Brimstone, or Galbanum, or else drown them in water; by which means, the ho-
ney will become sweeter and purer.

Famine is caused especially two manner of ways; either by scarcity of provision, or the
badness of it by reason of corruption: when there is great want you should supply them with
Honey, sprinkled in a liquor made of wine and honey boyled together, give grapes or
figs bruised or pounded together, and sugar-tops. Pliny would have them fleth given to them, al-
though he saith that Bees will not touch any fleth whatsoever. Now the corruption and un-
soundness of this meat, doth procure first of all, longings, scowtings, barrennesses, and consum-
tions; from whence, and by the fSmooth of dung and dead corpses, ill fLavours, plague and pur-
fication, with other dysenteries doarife. In their longings desire of what they fancy, they grow so
nice and peevish, that disliking all things, they are ready to fly away, unless with the perfume
or vapour of things of a very pleasant and grateful odor, with exquisite playing upon the hum-
ble pan, and exceeding next handling of them, they be retained. Also they are taken with a lask
or lossiness in their bellies, both in regard of the sugarmife of the juice it self; as also in regard
they feed on those herbs and leaves that are purgative, as Helloebores, Spurges, both kinds of Elder.
For being greedy of food after their fafting all the Winter, aslon as the Spring comes, catching
more greedily, than in way to their health, every herb that they light on, without putting any
difference, having gathered unwholsome honey, they are taken with a cacomity, or ill humour
or habit of body, and afterwards very suddenly fall into that lask or lossiness, afore spoken of.
Against this diftife (faith Pliny) let them services with honey, or wet with man or oxe pife.
Alfo Pomegranat kernels moflylened, with wine of wilde Briony; Pallasius much commends
the kernels of Pomegranates or Raisins boyled and pilled, with Manna or sharp wine bee before them
in wooden gutters; alfo he bids quicke in Honey boyled in wares, with the powder of Galls, dried
Roffes, or Rofmary, or fet it in with little fawcers.
Moreover, care is to be had, that they do not bring home any food gathered in the woods,
where for the most part do grow harth and lowre herbs, with the actimony thereof the bellies of
the Bees are moved, and are scarce stayd but by the presence and accurate endeavours of their
keeper. From whence proceeds barrenness, because by that means for want of feed they do not generate, or cleat (by reason of barrenness) they are not able to hatch their young, or
constantly to fly upon them; or to avoid the snares of the Spiders which are drawn over the mouths
of their cells. This consumption and bellcock fever increasing yet more and more, Higinus bids
that flowers be brought, fooked in dew or a sweet liquor made of wine and honey, and to lyeed,
to the holes or vents of the Hive. Alfo he commends for that purpoze Violets and Buglofe
flowers hebfplinked with new wine boyled halfe away, after that their Hives being very well
cleaned, and the vermire and dead Bees rid out of them, they are to be perfumed with one
or calves dung; because that takes away purification and infection; and doth infill a new life
or foul (if Calonemlia fay true) into the almost expiring Bees. They are alfo full of lice (as
Florentius relates) the which he cures with the shavings of the Pomegranate and wilde Fig-tree
burnt to ashes. The fame Authors cure the dunnefe or purblindnefe of their eyes with the
powder of wilde Marjoram. They themfelves are able to take away their fcurf and dandrif,
with a gentle rubbing of their bodies against the herb Celandine, and against walls tained
with urine; their dunnefe they cure with baths, and their throat with drinking mineral
waters.

The diseases that come of moiture, are swellings in the neck, tumours in the head, droplies,
which the Ancients used to cure with dry herbs, and shaking off the dew from them betimes in
the morning, and our country people do somewhat abate it, by keeping them from common
water, for they keep them three daies together in their Hives, by which it comes to paffe that
not only the superfluity of the bad humour is dried up, but the natural moiture is in some mea-
Sure regained. Haschius writes of a diftife very common to Bee which he calls Kesper, but what
it is he doth not tell us, neither could I learn from any other Author, what or what manner of
diffete it should be.

The diftifes proceeding of cold are congelation, nummednefe, fitinesfe, and other of that fort,
for you shall see them sometime so nummed and liffe with cold, that you would not think
they had the least motion, much liffe breath. On the other fide, through extremity of heat, they
are driven into madness, exceed of thirt, Feaven, Vertigo, and swimming in their heads; yet they grow dark mad, at which time they know no man, nor their keepers, and will strike their friends with somewhat venomed stings. In such sort therefore ought their Hives to be placed in both fessions of the year, that in the winter they be not too much oppressed with cold; and in the summer, that the shade of the trees do not keep the heat from them. Bees do fall also sometimes for want of illue, as in the plenty of patience it happens to come to pale, at which time they set upon their work in making of Honey, that the care of copulation and propagation is quite laid aside; and so the separation of illue being omitted, the whole Swarm being spent with labour, is extinguished. But when they fly away in storm and anger, by reason of their Hives being not kept sweet, or for some pellentif disease that reigns amongst them; you must follow after them, and with that Art (Palladia hath taught) being found again, entertain them in clean Hives, and remove them from the place where they were before into fresh dwellings. Moreover, Pliny saith it doth very much conduce to the keeping of Bees, that they be lawfully and honestly come by, that is, that they are either given or bought, for if they be stolen they fell doves thrive and come to good; as it is with Rue or Herb of Grace; if stolen it very hardly grows.

Now if we shall have removed from Bees all creatures that annoy them, what we shall yet further add to the conservation of their health, and the cure of their diseases, I do not see. First, therefore remove from them all filthy Ledges, menagery persons, those that have the running of the reins; baths, smoke, dunghills, layilals, all those that sinfull of great or kitchingflutes, or having nothing else to do, or on purpose to offend them, stand before their Hives mouth. The air being infected with the breath of Toads or Serpents, purge with Balm, Gentle, Thyme, or Fennel burned. See that they live neatly and daintily; kill all preatory or devouring venom, and the signs or symptomes of their diseases being perceived and known, apply the cure of them. Now the signs of Bees, as of other creatures also, being not well, are gathered from three things, that is to say, from their refraining to be in action, from the external garb of their bodies, and from their excrements. For the loile of mirth, lymph melancholy, vertiginous or whirling gate or motion, their frequent and take flanding at the door, their fainting in their work, their disfain of flowers and honey, their more then ordinary either sleeping or waking, unwonted hummings, are an argument that the Bees are ill at ease. As also when their bodies are unhandsome, not trim, rough, not sleek or smooth, fierce or faid, nor thinning or glistening, lean and transparent, not well liking, or well fed. Moreover, if their combs have an ill favour, or if their dung or ordure turn to ware, or be full of worms, and when they carry out every day their dead, not at all regarding their Hives; these are infallible signs of sickness, and some epidemicical disease that reigns amongst them, some part of which Virgil in 4. Geo. hath elegantly, though somewhat confusedly touched in these verses following.

If Bees be sick (for all that live must dye) That may be known by signes most certainly. Their body is discoloured, and their face Looks wan, whose flowers that death comes on space. They carry forth their dead, and do lament: Hanging by th' door, or in their hives are post. Hunger and cold consumes them, you shall find They bese, as doth 'twas woods the Southern winds. Or doth the sea when that the waves return, Or fire clea'd up in vauls with wise doth burn.

And thus their distempers being understood and cured, they live to extreme age; which Aristotle, Theophrastus, Pliny, Virgil, Varro, Columella, Cardan, and all Authors whatsoever, do conclude not to extend it self to nine years. Although I saw it by experience, and with no leeff delight to be otherwise at Hanworth in the Countesse of Somertes Bees (before spoken of) (there are yet present wizircles, who are worthy of belief which will attest it) that there they have lived in the same place above the space of thirty years; and almost four times a year, have made our fresh flights or twarms of young ones. Which reason doth induce me to believe that Bees in their own natuer constitution are long lived, and I do with Albinus alone make a question, whether they may not live to long till they dye of old age. Well I know they may be taken away by diseases or incursion of their enemies; but if they have alwayes all those necessaries for their life and health by them, and those things which should be delitiously kept from thime, I should easily grant that they would live to a very extending great age, if I did not altogether say they were immortal. For they alone, of all other creatures, are fed with Honey that immortal Nepet, drop down from heaven, and with that divine dew (which is the soul and spirit of all herbs, trees, and plants) gathered together into one body or maffe; of whose nature, use, and excellent vertue, we shall speak in the following Chapter.
Of lesser living Creatures.

CHAP. IV.

Of the use of Bees.

Whereas the most high God did create all other creatures for our use; so especially the Bees, not only that as midriffers they might hold forth to us a pattern of Politick and Oeconomick virtues, and inform our understanding; but that they might be able as extraordinary foretellers, to foreknow the success and event of things to come; for in the years 90, 98, 113, 208, before the birth of Christ, when as mighty huge Swarms of Bees did settle in the chief Market-place, and in the Beast-market upon private Citizens houses, and on the Temple of Mars there were at that time stratagems of enemies against Rome, wherewith the whole State was like to be surprized and destroyed. In the reign of Severus, the Bees made Combes in his military Ensigns, and especially in the camp of Niger. Divers wars upon this ensued between both the parties of Severus and Niger, and barrettes of doubtful event, while at length the Severian faction prevailed. The Statues also of Antoninus Pius placed here and there all over Paguriae, were all covered with swarms of Bees; and after that felled in the Camp of Caisius; where great commotions after followed Julius Capitolinus relates in his History. At what time also through the treachery of the Germans in Germany, there was a mighty slaughter and overthrow of the Romans. P. Fabius and Q. Elia being Consuls in the camp of Drusus in the tent of Hesilius Rututius Swarm of Bees is reputed to have fate fo thick, that they covered the rope and the spear that held up the Tent. M. Lepidus and Minus Plancus being Consuls, as also in the Consulship of L. Paulus, and C. Metellus Swarms of Bees flying to Rome (as the Angors very well conjectured) did foretell the near approach of the enemy. Pompey likewise making war against Caesar, when he had called his allies together, he left his Army in order as he went out of Dyrrhachium, Bees met him and fate so thick upon his Ensigns that they could not be seen what they were. Philoemen and Eria relate, that while Dionysius the Tyrant did in vain imp his horse that stuck in the mire, and there at length left him, the horse quitting himself by his own strength, did follow after his Master the same way he went with a Swarm of Bees sticking on his mane; intimating by that prodigy that tyrannical government which Dionysius affected over the Country. In the Helvetic History we read, that in the then year 138, when Leopoldus of Anesia began to march towards Sempachum with his Army, a Swarm of Bees flew to the Town and there fate upon the rye, whereby the common people rightly foretold that some foreign force was marching towards them. So Virgil in 7. Ennius.

The Bees flew buzzing through the liquid air And pitch'd upon the top o'th' Laurel tree, When the Southfayers saw this sight full rare, They did foretell th'approach of th' enemy.

That which Herodotus, Pausanias, Dio Cassius, Plutarch, Julius Caesar, Julius Capitolinus, and other Historians with greater observation than reason have confirmed. See Acrephonius, when he could by no means find the Oracle Trophonius; Pausanias in his Boeticks faith he was led thither by a Swarm of Bees. Moreover, Plutarch, Pausanias, Eliaus Alex. Alexandrinus Theocritus and Tertor are Authors that Jupiter Militans, Hero of Syracuse, Plato, Pindar, Apis Cato, Xenophon, and laft of all Ambrose, when their nunes were abvnt, had Honey drop into their mouths by Bees, and so were preferred. Xenophon also in his Oeconomicks calls making of Honey, the job of Vertue, and to it would have matrons and mothers of families: go be instructed. The Poets willingly yeeld themselves to be compared with Bees, who following nature as their only Mitleafs, use no Art at all. And so Plato affirms that Poets were never able by Art to finifh any maffe piece. Intomuch that Pindar doth vaunt himself in this to be superior, or to go beyond Bacchides and Simonides, in that he was taught by nature, not by Art, Bees unless provoked are harmless, but being vex they will sting and that most shrewdly. Such is the condition of Poets; from whence are ocassioned these verses of Archilocheus.

He that doth move me, quickly finds my sting I'll make him cry, and through the City ring.

Wherefore Plato in his Minos gives it as a rule to those that desire peace and quiet, that they be very well advised how they intermeddle with Poets and Bees. To conclude, so many are their virtues worthy our imitation, that the Egyptians, Greeks, and Chaldeans took divers Hieroglyphicks from them; as when they would express subjects obedient to their Prince, they set it forth in figure of a Bee very singular in that virtue; when a King loving to his subjects, they portray it likewise, and set it forth by a Swarm of Bees. Other the like emblems are to be found in Parius Hieroglyphicks worth the labour of searching for. From them the Country people learned their skill of prognostication of the weather. For they perceive wind or rain before.
it comes, and foretell storms and howres that are at hand: when they are ready to come, they retire not to fly far from their Hives, but will feed themselves with their own moisture. All these things being as they are, 'tis no wonder that Aristarchus Philostratus, Aristomachus, Selenus, Menuis Summner, and six hundred others that have wrote of Bees, have left the pleasures and delights of the City, and for 58 years to have lived in the woods, that they might be the more perfectly acquainted with their conditions and manner of life, and be the better enabled to commend them for an example to polity. Neither was Virgil's the worse for being so well seen in their History, the which he hath most elegantly set down in the fourth of his Georgicks.

But what their bodies and their labours do work upon our bodies, it is now worth the pains to relate; whereby we may alluredly know, that there is nothing in Bees but what doth serve for our health and welfare.

First of all, their bodies, as ison as they are taken out of the Hive, and pounded and drank with some distick, or wine and milk; do strongly cure the dropsie, dissipate the stone or gravel, open all the passagges of the urine, cure the stopping of the bladder. Bees that die in the honey, cure impometimes, and help the dulness of sight or hearing. Also being pounded together they cure the griping or winging of the belly or guts, being applied to them. If powdered honey be drank they themselves being drank down after, do expel it: they soften hard ulcers in the lips; being bound to a carbuncle or running sore, they heal it; they cure the bloody flux. Honey being strained with them, helps the crudities of the stomagh, or specks or red pimples in the face, as you may see in Helerus, Alexander Beach, and especially in Pliny. Take Bees dead in the comb, and when they are through dry make them into powder, as Galen in Epist. writes, mingle them with the Honey in which they died, and anoint the parts of the head that are bald and thin haired, and you shall see them grow again. Pliny in like manner teaches to burn a great company of Bees together, and mingle the ashes with oil, and anoint the part; only with this caution, that the adjacent parts be not touched therewith; yea, Honey creeped of Bees that are dead, he affirms to be very sovereign in all distastes, and very useful. Erotis in his 61, chap. de Morb. muliebr. tells us that their Athes better with oil, is good to make the hair white.

Moreover, Bees are very profitable and useful in regard they serve for food to other creatures; as to the Bear, Lizard, Frog, Serpents, Waps, Swallows, Houp, Robin-red-bres, Turnquotes or Myskin; as Bellonius hath observed.

Palladins faith, that some men are wont to take great delight in hunting after them; and he tells you how you shall finde them out in these words, In the moneth of April, in sunny places, if the Bees do frequented retfort theither, either for food or waters then certaint it is, that their nest or Honey-shop is not far off, but if there come thither but a few in a company, then 'tis a sign that they harbour farther off. But when they come very thick, by this trick you shall finde out their Swarms, take a little wet Oake and mark them on the back, and there remain, while those that were marked return back thither again, if they make a speedy return, then they make their abode not far off; but if they carry more then ordinary, then they reside farther off. Now by this means those that are hard by may easilie be found out; but to come at them that are more remote and farther off, do thus: take a piece of a Cane and cut it off at either end at the joints, and make a hole in the midst of it; there put in a little honey; or sweet wine boiled half away, and lay it by the side of the fountain or water: where they return, when the Bees come thither, and are drawn in by the scent of the honey, hold your thumb close upon the hole, and suffer but one Bee to go out at once, follow that as far as you can well discern him, when that is out of sight let go another, and by this conduct at length you will easilie finde the place where the Swarm is. If it be in some hole or cavern of the earth, make but a smoke upon the mouth of it, and all the swarm will hurry out, and when they come forth, being a little scared, with the turning of a brass pin, they will hang themselves upon a little bough as it were a bunch of grapes, from whence having a willow to put them in, you may take them away. If they chance to make their nest in the orn of a tree, then take a sharp twand and saw off the bough above and below them, and cover the middle part where they are, with a clean cover, then carry them where you please, and put them in a Hive...

By this Art you may finde their Swarms where they use in woods, dens, or hollow places, flax or cragggy rocks, or any place whatsoever; only see that you begin your sport betime in the morning, left the night over-take you, and you lose your game. Neither only are they delightfull sport to them that hunt them in the day time; but also (if Fabritius and Arscemdon do not deceive us) if a man light upon them in his dream when he is a sleep; if he be a poor man, it foretells he shall be rich; if a King or a great man, that his benefactors, of those that are under him will be loving and obedient. But he that dreams he had a flock of Bees, but in plenty hath them not, 'tis a sign of a decaying estate, and of some imminent approaching dissalter to follow. Of greatest use are Bees: and to variously hath done Nature the contrive of all things, spoiled her self, or rather taken great pains indeed in furnishing them with such rare qualities of all forces as where with you have heard them to be endowed.

But to what purpose is (will you say) that which poyson and venome Play himself knew no remedy? Icones, and experience teacheth as much, that Bees' wings are somet
times venomous; but it is only on those Bees which are raving mad, or burning with some fever, anger, or hunger. Otherwise they do little or no harm at all; and therefore Dr. Syston did not deign so much as to mention the symptoms of the stinging of Bees, supposing it a childish thing for any man so much as to complain of the sting of a poor little Bee: latter where he observes that the sting is accompanied with redness and tumour, especially if the sting do yet stick in the flesh, which it doth in very deep sometimes, as Nicander writes in his Theriac. The Ancients (that we may prove the sting of Bees to be converted to some good use) as Strabo reports, were wont to punish cheaters with them in this manner; They dip the malefactor's dark naked, and befetter his body all over with Honey, which does, and his hands and feet being bound, they exposed him to the heat of the scorching Sun, that what with the piercing taints, stinging upon his body, what with the stinging of the Bees and flies, and their often stabbing and wounding him, he did at length suffer a death answerable to his life. But if you would indeed resolve to go sting-free, or at least heal your feet being stung; expel out of your mind, idleness, impertinency, malice; for those that are detested with those vices, set upon to chace as it were, and out of natural instinct, Beware also in especial manner, you wear not red garments, which might represent you to them, to be a murtherer, or man of blood; as also that you be not taken by them for an unchaste or unclean person, which it seems they naturally and abundantly know and abominate (as hath been said before) They which carry the bill of a Wood-pecker in their hands when they come near them, although they do somewhat disturb their Swarms, yet (as Pliny says) the Bees will not hurt them. Nemeus reports, that if you rub and beat to powder the herb called Balm, or Balm-gende, their stings will not be able to hurt you. Florensus gives in charge, that he that is to gather the honey should annoint himself with the oil of juice of Mistle-mallows; whereby he may take away the combs without danger. But the juice of any Mallowes whatsoever will do the like; and the better if they be rubbed with oil; for it doth both preserve from stinging, and is a remedy to those that are stung. But be it granted that diseases be contracted by their stings; yet let us but take a few of these Bees that are found dead in the Honey, and let them be carefully applied, and they presently cure them; and take away all the venom and aching of them.

What shall I say? God never created a creature less chargeable, and more profitable. They are bought for a very little money, they will live in all places whatsoever, even in muddy and montaneous Countreys. The poor as well, as the rich gain a great return or revenue by keeping of them, and yet need they not put more in the pot, or keep a servant the more for them, Mervius reports that Varro rented at his Gloues of Bees, for 5000 l. of Honey; and in Spain, out of a little Village containing not above an acre in moit, that he gained of the Honey there gathered 10000 Seletries, i.e. 50 l. of our English money in one year. Besides all this, we have from their shops or hote-houses, Wax, Bee-bred, Bee-glews, Robin, Honey-combs such as no Common wealth can well be without; not to repeat their virtues, which are no less wholesome for the minde, then those are profitable for the body and maintenance of life. And first of all we will treat of Honey; that immortal, neerlasting, pleasant, wholesome juice, and principal of all works and operations.

**Of the Name, Difference and Use of Honey.**

A

The first Honey had but one name, called in the Hebrew, דּבש; but since that Strange and confudted Polyglotology, or speaking with divers tongues, it was called of the inhabitants of Arabia, Chob Harw, of the French, Miel; of the Italians, Miele; of the Dutch, Honick; of the Germans, Honig; of the English, Honey: the Greeks called it, ὄξυς, as the admirable care and industry of the bee, in making of it, as Euclides notes; from whence comes Melissa, Meletemia, ἔλεσις, in Porphyry. This for the Name: But what it is yet after all is much controverted among the learned. Some there are that fondly conceive it to be the fiddle of the Planets, or the golden falling from the Stars; others, the purging of the Air, or the Sweat of the Heavens; but in my judgement it may more properly be termed the Chymus of the Bees, gathered from some sweet matter, but having its perfection and consummation from their ventricles; and afterwards by expirations or vomits cast out into the cells or Honey-combs. Aristotles, Pliny, Avicenna would have the Bees not be makers of the Honey, but only gatherers of it: for thus they write: The Bees, (say they,) do gather the Honey from the dew of the air, especially at the rising of certain Stars, and from the conjunction of the Rain-bow; for they make no Honey, but Honey-combs only. Gaius also lib. 3. de Alimentis hath these words: I remember (faith he) upon one time, in Summer we gathered a great quantity of Honey from the leaves of the trees, and then the Coward in way of sport sung, *Hephaestus* raiseth Honey. But then the night before had not been exceeding cold; as it could be in Summer; for the strength whereof the sweetest stimulations, and vapours being drawn up by the Sun were congealed together. Now with us this is a very rare accident; but in Mount Libanus it happens every year; and therefore they spread skins upon the ground
The Theater of Insects: or, Book I.

The best Honey known.

The best Honey is more or less sweet and pleasant, and has a pleasant smell. It is different from other honeys in that it is not thick and sticky like the honey of bees, but it is a thin, clear liquid that is easily spreadable.

Accidental properties of Honey.

In what countries the best Honey is to be found.

The best Honey is found in countries where the climate is mild, the air is pure, and the soil is fertile. It is also found in countries where the flowers are abundant and varied, and where the bees can easily collect nectar from them.

The Accidents or accidental properties of honey, are likewise some good, some bad, both of them are taken from the season, place, quality. If you respect the time or season, the newer the honey the better it is accounted, and the Spring or Summer honey far beyond that is gathered in Autumn. The first of these is gathered from flowers only, and those very tender and newly budded (thence called Anthymum or Flower honey). The second is collected of nothing but herbs, and ripe flowers, thence called Aegnor, or Summer honey. The third, last and worst, is had after the first Autumnal flowers; and that very sandy or gritty and woody, gathered only of Heath or Ivie (which are then the only things green that are left) and thence is called Ericum, Heath honey or Ivie honey: all which (as I said before) have their greatest commendation from their freshness or newness, because with long keeping and concocting, they wax bitter; from whence the Proverb, He that will make a good mixture of wine and honey, must mingle with new Hymetrian Honey, old Falerian Wine, It is also better or worse in regard of the place where propert or common. If you respect the propert place, or the vell el wherein it is contained; the best honey is still found in the bottom, for the droes which is contrasted either by foul of herbs, or by the air whilst it falls from so high a place, is call up to the top as froth: and in the bottom it is found to be more glutinous, pondeous, luscious, and better com pacited.

If you would attend the common place or region wherein it is gathered, according to the nature of the Countries, so is the value of it.

In the first place and above all other, the Attick, Athenian, Hymetick, especially when made in the silver Mines, hath been hitherto adjudged the best honey, both in regard of the excellent nature of the Bees themselves, as also for that those Countries do abound with Thyme and other choice plants and herbs, and likewise in regard of the goodness of the where the combes are made. Disporides gives the next place, to the Islands of the Cyclades, or the Aegean Islands (which is very luscious and pleasant, and weighin as good as the Attick) And the third and last place to the Hybemans and Sicilian.

Johan Bammius a very learned Physician, and surprasingly well seen in the knowledge of simples, said that he saw of this Attick honey in Verona in an Apothecaries shop, which he found put up in the bladder of an Elephant, very thick, and weighing 21 pounds, of the length of two cubits, of the breadth of a cubit and a half. I suppose it was brought thither out of Attick for how should an Elephants bladder be had in Athens? In the judgement of Cardusman, that honey which comes from Cephalicis, an Island in the Ionion sea is the best; next to that in Europe, is the Spania and that but without reason; in regard the dew for the most part in those better regions is better concocted: and (in all Countries) where the purest air is, there is the virgine Honey (i.e.) pure pale, and is made up as it is, having no need of fire to purifie it. The Therzi-
The honey is also commended, as Strabo reports, about Tagodes, Melita, Hes, Hacora, the iron Mountain Rhabinos Echeteveuse; yea, so faith there is very excellent African honey made, Ludovici Cadommatius prefers the honey of Sinjeron. Andreas Corfilius the Mombarten, Eduardus Barbous the Ethiopian, Thomas Lopius the Catholic, Franciscus Albertus the Tigromeumhenian, Sebastianus Baro the Somagittick, Enryan the Lituanian. Eunias Stella the Rustian, Thuer the American. P. Livius is exceeding much in the commendation of Majoey honey, but not so advi-
sely, in as much as our Merchants and Sebaft. Baro a very impartial writer of those things which are seen and done there, do very seriously affirm that in all the Dukedom of Majoey, there are
neither Bees nor honey, Alberti Campeprus in his history of Myfia is which is called Brixia, faith
that even in the Hesitan woods, there is extraordinary good honey to be found, and that alto-
gether as good as the Cteopatian or Attick honey may be. A Fustus affirms that in snowy and
icy Scythia there is Country honey very prate-worthy; and that it is carried to Myfia (where it is
fold at a very dear rate). But if the heat of the Countrey doth add to the honey, purereness
and goodness, how is it possible such excellent honey should be had in Scythia, and Samogitiana?
Is it because the flowers there growing and receiving the dew are better then in other places,
and by that means cause it to be clearer and pure? Or is it because of the North winds which are
most frequent in those parts, which do purge the air? Or is it because as well Bees as men there
are of more strong constitutions, and therefore are better able and do take more pains to refine
and work the honey in their ventricles? which is the more likely, seeing they were not able
to live at all in that cold region, nor could not arrive at such an Age (for those they live very
long) if they were not very healthy and lusty of body.

Now whereas Cardan denies that there is any exquisite honey made in moist Countreys; let
England and Ireland challenge him for their right; which being obnoxious to flowers and very
much rain, a thing toall fatal to this, do yeefd such extraordinary pure honey, that it hath not the
least mixture of venome, and doth last a long time before it be corrupted or purifed; that we
do not speak of its excellent whiteness, hardeness, sweetness, shining well together, vicinity and
ponderousness; and other principal signs of the goodness of it; but let us leave off to commend
our own Country wherein good is to be found; and let forth those Countreys which are in-
famous for the badness of it. For the extreme bitterness the Cholchian honey, and next the Corfican
and in some places the Hungarian, and the Sardinian hath an ill name. For in Sardinia Woodworm,
in Corsica Rose-lawrel, in Colchis the venomous Yew, and all of them in Hungary. Also the ho-
necy is venomous in Heracles of Pontus; and in the flowers of Goats-bane fading with the wet-
ness of the spring; for then the flowers contain that hurtfull venome; which doth presently
infect the honey-dew that falls upon them. There is also another kind of venomous honey
made, which from the madnes that it causeth, is termed Mald-honey; which Piny conceiveth
to be contracted from the flower of a certain shrub, very frequently growing there in the woods,
Discoeris and Actiga do not amiss impure this poyson to be caufed of great pleye of the veno-
use herb called Libbardus, or Wolf-woot which groweth there; in that it is cured with the very
same remedies as the venom of that herb is. In Carina, Persia, Mauritania and Getulia,
bordering to Mothesania, either by reason of vapours of the earth, or by reason of the virulent
and poyzonous juice of the plants, poysoned honey-combs are produced; but are defcried by
their diskike or blackish colour. In Trapaecantum in the Countrey of Pontus, Pliny reports of a
certain honey that is gathered of the flowers of the Box-tree, which as it doth make those that
are well sick with the notyome smell of it, so those that are not well it retiores to health. On
the trees of the Hectocountaros, a people near unto Colchis, there grows a kind of infectious
honey. Which poyson being drank makes men stupid, and out of their wits. This was sent
by the enmy to the three Legions of Pompey with a token for the desire of peace, they drinking
very freely of it, were put both besides their wits, and their lives too (as Strabo faith). Ovid
makes mention of the Corfick honey very infamous, being extracted from the flower of Hem-
lock, speaking thus:

I think it's Corfick Honey, and the Bee
From the cold Hemlocks flowers gathered thee.

But yet it may seem to be not so much for Dame Nature's honour, that she should bring forth a
thing to defraud of all men, as honey is, and so ordinarilie to temper it with poyson. Nay but in
so doing the did not amiss so to permit it to be; that thereby she might make men more caut-
ious and lefe greedy, and to exercise them not only to use that which shoud be wholesome, but to
seek out for Antidos against the unwholomeines of it, And for that cause the hath hedged the
Rose about with prickles; given the Bees a stings hath infected the Sage with Toad-spit; mixed
poyson (and that very deadly too) with Honey, Sugar, and Mamm.

The signs of poysoned honey are these, it stains the honey-comb with a kinde of Lead-colours,
The sight of doth not become thick, it looks of a bright shining glittering hew sharp or bitter in taste, and hath
a strange and uncomely smell; it is far more ponderous, than the other; as soon as it is taken
cauteth neceth, and a loouness of the belly accompanied with excess of sweating. They which
have drunk it do tumble themselves up and down upon the cold earth, very desirous of refrigera-
tion. The Heraclean poyson'd honey hath the same symptomes with the poyson of Wolfs-bane,
and hath the same way of cure. Galen reports that two Physicians in Rome tafted but a very small quantity of poiyioned honey, and fell down dead in the open Market-place.

Against madness from eating honey, *Dioscorides* prescribes Rue to be eaten, and falt fish, and honey and water to be drank, but being taken they must be vomited up again; and he promises the fame remedy against this disease, as he doth against Woe old banes, and Rofe-laurel: and *Pliny* agrees with him; also he adds one singular antidote, to eat a fish called a Gilt-head, which alfo wonderfully corrects the loathing of good honey. *Galenius Placentius* bids to take venitc abundantly, with Synup of Violets, aconite simplex, and warm water, eating falt fish before vomiting. Afterwards he gives Theriac with hot vinegar. *Christophanus de bonfigo* prescribes vomiting, and to set cold water under the nothriils, with the flowers of Violcs, Wafcuties, and Fleavort. But his Bezoar stone, are Quince kernels bruited, and given with hot water, as *Sanctus Arduinus* relates. *Avicenna* hath prescribed nothing worth speaking of, but what he had from others: for I understand not what he means by his *Amuleti*. But what if a youth and an English man, after so many grave and experienced Physicians should affi¢ this for a certain Antidote, viz. to take nothing down, but the Bees themselves. The likelihood of the conjecture doth perfwade, and reason it well doth somewhat seem to favour it. For unless that Dame Nature had in them Bees, a very marvellous power against poiyoned honey (as amongst men to the Puli against Serpents, to Storks and Pelecocks amongst the Birds) without all doubt with gathering of it, inwallowing of it, and for some time keeping of it in their bodies, yet concocting of it there, they would be grievously pains, and the poison running and diffpering it felt through all the parts would kill them. Now the Terrestrial honey, although it be not alyways poyfonous, yet by reason of the blackness and clamminess of it, 'tis not much to be commendcd: also it is often found to be subject to be infected by the venemous breath of Serpents, Toads, red Toads, and therefore is carefully to be avoided. Now let us come to the Qualities of Honey; whereof some are fuft or primary, others derived from them; some fomel, some fpecifical, which we defervedly call Energetic, or operative. In refpect of the first Crafts or temper, Honey is thought to be hot and dry in the fcond degree, for which cause Galen did forbid thofe that are in Heftick Fevers, and in all Fevers, young men, or thofe that have the yellow Jaundies to use it; whereas in cold diltempers he doth very much commend it, and did prcfcribe it to thofe that were troubled with a raw and watryfor- mach; whom if you gently anoint therewith, it doth very much nourifh, and caufeth a good colour and confitution of body. If you defire to know the fcond qualities of honey, (viz. the smellings, faining, visible, tacftle) the beft honey ought not to have the eminent quality of any herb, or other thing whatsoever: and therefore the honey that doth strongly defmell of Thyme, Galen rejects; and yet is of itelf a molt sweet and fragrant smell, and not without a certain spirituous fragranfly; fuch is that which in the middle of the fpring, is perceived to be in the air about break of day. But if it have an ill flavour, it is purified not being well kept. If it smell strongly, it hath con tradled some conufion from Hemlock: if it fting as it was and prick the nose with its fcent, it is an argument of some poyfon, or too much acimony couched in it. If it fmmell not at all, it is ftrongly dead, no spirit in it. If it fmmell of Thyme, Linden, or Teif-trees, Rosemary, Balm, Wormwood, eft. it fheefs that it is degenerated into its nature. The like is to be faid of the fale of honey, which is known either by the herbs, age of it, or by the colour of it to be mixt, or adulterate, or natural, that is to fay, striking, and filling the tongue with a certain fine and lively sweetness, fo that it may seem to fome to be a little tart. As for what concerns the colour of the beft honey; in the Tigremanhick and Tageldeick Region, that of a milky colour is preferred in hotter Countries, that which is white and tranfparent, but commonly that which carries away the garland and is esteemed above the rest is yellow, and of the colour of Gold. And in the fcond rank is that which is white and transparent, which I with *Aristotle* fhould put in the first place. For that it is a fign of pure honey and not infected with any tincture of herb: The bright fhining is alfo by him commend'd if it be not fummer honey, for the honey that is gathered at that feafon of the year (like wax or butter) either by reafon of the abundance of yellow flowers, or the fcorching heat of the air, it comes to be of a deep and full yellow, yea almoft quite red. But if the Erycra or Anthine appear red-flift, it is not without caufe accounted unwholfome, because it is not in its feafon. Suspected of and ill name, are the black, duskie, bright red, and above all the lead colours, which whether they appear in the comb, or in the honey, fometimes are evident figns of corruption and purfaftion, and fometimes of poyfon. That honey is belt in touch that is fat, clammy, gluttonious, heavy, and molt like to the clear liquor of Turpentine eyew here like it fells, that is pure without any con, or with very few dregs, that is melted with a very foft fire, and with the leaf cold as it were congealed into little fomes. The Energetical or operative qualities of honey are feen in the use of it; the which is of divers forts, whether you turn to the Apothecaries shop, or to the Kitchen, for it may both doth it nourifh, and peferve health entire, and men long-lived; the which the Greeks thought the *Cyrenians* by reason of their constant using of it, lived long, being old men, as *Herodotus* , *Athenaeus*, and *Diotorus Sicinus* reliefe. *Pollis* indeed being asked how it came to pass that he lived to be fo old as he was, made anfwer, Because from his youth he used Oyl without his body, and Wine mingled with
Honey within. More then this all flowers, fruits, simples, and compounded medicaments, or concoctions by mingling them with honey are preferred entire from purgation; in which faculty or virtue it so excels, that even the Babylonians were wont to bury the dead corpuses of their noble men in it; as Herodotus witnesseth, Thalia. Vintners also and such as deal in Wines that will play the knaves, when they observe a piece of Wine decaying, and at its leaf almost then they put honey to it, to bring it to the health again; by which means the sippificate wine appears more, and refilishes very well upon the palate, though never so critical and curious. It is not subject to putrefaction. Fruits and all other bodies are kept in it very long. Yet if it be but touched by its enemies, breaks it putrefies. They therefore that sell honey, are very wary, lest children as they put by should dip their bread in it: for so it will presently corrupt, and turn into Ants or such like creatures; if we will believe Paracelsus, for his natural skill, in the nature of things, a most famous Philosopher. With admission of honey also Galen amended the naughtiness of sweet meats when they begin to fail. Honey mingled with other things, does both nourish and cause a good colour; but taken by it self without any other thing, it doth rather make the body lean than nourish it; because it doth cause urine, and purge the belly beyond all measure. Hippocrates, if you take the seeds of Cucumbers, or the seeds of any other plant, and keep them for some time in honey, and afterwards sow or set them, the fruit that growth of them will taste the sweeter.

As for the medicinal and Physical virtues of Honey; it causeth heat, cleanseth sorens and ulcers excellently, warmeth them away, and removes them in what part of the body (as you gathered;) virtues of Honey.

As Galen, Avicen, Celsius, and Pliny have observed. It perfectly cureth the disease which causeth the hair of the head or beard to come off by the roots, called the Foxes evil, and other filthy ulcers of the head. Plin. To regain hair lost by the disease aforesaid, and for long Agues, it is very effectual, if the party be anointed with it raw as it is; or with the honey-comb newly dried or emptied, Galen. But above and beyond all, the Oyl of honey distilld doth effect it. The ware; that dropeth from the honey, doth excellently cleane the skin, provoke urine, extinguish the burning heat of Fevers, open the obstructions of the bowels, quench thirst. The chalk or salt of it, as it is of all corrosives, the least painful, so it is most energetic and operative, and therefore is very much commended by Chymicks, and Chirurgeons, for to cure that kernel or tumour of flesh which growtheth upon the yard. But how many, and how ample virtues that quintessence of Honey (as they call it) hath attained against the strength of all diseases whatsoever, is excellently described by Iulius Belgas, the predecessor of Paracelsus. Nay without doubt, if we take the Oyl to be, and raw, were able to prolong the health and life of Democrats, Pelio, John the Baptist, in a word, of the Pythagoreans, and Cynrians (as aforementioned) how much more will it do being refined, and heightened to the highest degree of nutrition? The Epicureans who took the best way they could to provide for their health and their pleasures, fed all ways upon Ambrosia, as Titus reports, which did consist of a tenth part of honey; as if they meant by the use of it, to starve off all pains and griefs, and live free from all diseases and maladies. It doth wonderfully help the ulcers in the ears if be powered warm into them, and especially if an ill temper be joined with them. Moreover in their hilling, noyces, inflamationes, Galen commands to infill Artick Honey, Buttres, oyl of Roses, and as much warm water Maccullus Empyrion to infill into the ears that was pained. The same also very much commends honey mingled or kneaded with the oordure of a young Infant, to cure the dulnes of the fight, and the white spots in the eye. Vegeta by this means cures the watery eyes and dropping of the eyes caused by rheume or dilatition. First of all a little below the eye he drawes blood and anointeth them with the purifyd honey till it be whole. But yet care must be had (as Columella very well hints) that as often as the eyes are anointed with honey, they be besmeared round about with melted pitch and oyl, left the Wafps and Bees infest and hurt them. Hear also what Macellus saith, touching the clearing up the eyes, and he prescribeth this: The honey pure and neat wherein the Bees are dead, let that drop into the eyes; or honey mixt with the ashes of the heads of Bees, makes the eyes very clear. And again mingle Artick honey with the first oordure the Infant makes, together with the milk of the Nurse; and with that anoint the eyes that are so dulle whatsoever the cause of it be; but if at all you must binde the patient to a form or ladder; for otherwise such is the strength of the medicine, that he will not be able to endure it, Which is such as a perfect remedy, that in three daies, it will fully restore the sight, and take away every blennith of the eye. The Gall of a Vulture mingled with the juice of Horchoud (twice as much in weight as the gall is) and two parts of honey cures the suffusion of the eyes. Gal. in Every. Otherwhere he mingleth one part of the gall of the Sea-Toaful, and four times as much honey, and anointeth the eyes with it, Serenus prescribes such a receipt to cause one to be quick sighted.

Mingle Hyblean honey with the gall
Of Goats, to good to make one fee withall.

Give Infants butter and honey, for nothing is better for their breeding teeth, and for sore mouths. Galen bids us rub their gums with nothing but honey. For it wonderfully helpful to their breeding of teeth, preferring, cleansing and beautifying of them. Alfo against the pain of the jaws. If with Arabian honey you joyn field-poppy, it cures it. And sometimes pure honey
is mingled with clear water: and this, as *Serenus* and *Pliny* testify, doth notably cure the dinites of the tongue in Fevers, the Qui�es, and the diseats of the Lungs, Throat, Jaws, of the Tongue; against difficulty of breathing, and to cause one to expectorate, either by it itself, or mingled with other things: it is highly commended by *Hippocrates*. And for the convulsion of the lungs (which is often to be a deadly disease) the drinking of cold water, and of that where in a honeycomb is steeped is very effectual. Also, if the stomack be not hot, cholericke, bitter, nauseating or feverish, it makes it strong and vigorous, and nourisheth it much, not suffering milk to curdle in it: it cleanseth the reins, boileth with water and butter it is good against the Cite.

*Articenn.*

It easeth the pain of the spleen, but it must be outwardly applied with the bead Bees; for taken inwardly it hurts both the liver and the spleen, saith *Galen*. When it is raw it looseth the belly, but boiled with the Bees, or with new cheese, it bindeth the belly so much, that *Galen* holds it to be a secret against the Dyfentery and collick pestilions: so both *Celus* also and *Pliny*, *Hippocrates* mingled honey with all Medicaments that were to soften the belly. Honey mingled with royn, is a cure for the cold Tificioles, as *Pliny* saith, who also affirmineth that the ashes of Ox-leather mingled with honey, cures all running sores and bitches. Nitre with honey and Cowes milk, cures ulcers of the face; and the froth of honey with oyl of Walnuts, amendeth the burning of the skin: it is excellent for old people, and such as have cold stomachs: and being boilèd it diffuseth wind, and moves urine mightily. *Galen*. *Helleriius* reckoneth honey amongst Diaphoreticks, because it openeth and maketh the paflages clear: *Galen* placeth it amongst Diuretisks. It layeth down its acrmony by being mingled with water, or being boiled: and therefore *Galen* prescribeth boyled honey, to close up ulcers that are hollow. Salt with meat and honey taketh away the pain of a joynt that is dislocateth, diffuseth the dwellings, and makes it more apt to be reduced. I might here set down the paiter of *Attius* and *Agina* of *Dinummellum*, the *Tapiemel* of *Arden*, and all syrops that were anciently made of honey. In whose place the Neotericles have put sugars, but I know not by what reason. For if honey of Aethen or some be good, be at hand, and doth not want its due preparation, do not use sugars that is earthly, reedy and so full of dregs, not comparable either for use, original, or any way whatsoever with this heavenly dew honey. But to let this pass, let us reckon up the kinds of drinks and meats made of honey. Six kinds of honey—drink the Ancients made principally. Honey and water, honey and wine, honey and vinegar, the washing of the combs, juice of some grapes and honey, mead and honey.

The first is called by *Pollux* and *Nicander*, *Hydromel*, or *le[m]en*. *Galen*, *Pliny*, *Agginis* and *Dioscorides* have set down the making of it. *Hydromel* of *Galen*. Take sweet pure clean fountain water 8, pounds; the belt honey 1, pound, boyle them at a soft fire in an earthen vesell, take off the skim a top off times; and boil it to its thickness. If it must be drunk presently, it must be made thin as water, if it must be set up to keep, boil it longer, till it be thick as a julep: if it be kept long it pierceth deeper into the parts far off, and is sooner converted into choler. Also boyling acquires to it many more faculties; for being little boyled it inflates more, it purges more, and nourisheth lefe. Longer boyled, it diffuseth wind, nourisheth lefe and purges lefe. It is fpaced at pleasures with Ginger, Saffron, *Cagationis*, *Walnuts*, *Gallia Moriaca*, etc. It is made in another way, of honey 1, pound, water 8, pound, leaven 3, ounces; put all in a wooden vesell, leaving three or four fingers empty that it may work the better: when it hath done working, stop the vesell and let it be well hooped; and after three months it will be fit to drink. *Hydromel of Pliny*. Take of pure rain-water that hath been kept five years, 12, pound; boil it to thirds, add to it a third part of old honey, and in the dog—dais set it in the sun for 40 days, and letting it so stand, on the tenth day stop the vesell, this is called *Hydromel*: that with age will taste like wine, made no where better than in Phygia. It was given to ficks that desired wine, but now it hath been forbidden many years. *Hydromel of Agginis*. Take the juice of bruised Quinces 4, pounds; fountain water *Sexta*ri, boil them till they grow soft, take them out of the fire, let them cool, then strain them, and crusth out the Quinces and cast them away, add to this water half honey, boil it, cum it, till an eighth part be consumed: some make it of sweet Apples or Pears the same way. *Hydromel of Dioscorides*. is made of two parts of old rain-water, and one part of honey mingled, and set in the Sun. Some call it *Hydromel*, because it is wont to be made of the washing of the honey combs with water, but it must not be made stronger, because it will hurt ficks people by too much matter proceeding from the wax. *Hydromel* after it hath been long kepy, is as strong as small wines, or *Lora*, being but half so old. Wherefore it is preferred before them in abating inflammations. The use of old *Methelun* is condemned, for such as are inflamed or coffive, but it is good for weak stomacks, and such as loath their meat, or fick people that Swath much, or for those that are thirsty, or after a burning feaver hath waffed a man. *Attius* describes a Clyster only of honey and water to move the belly, and with the same he cleanseth hollow ulcers. *Galen* commends, and ues Melicrate (wherein some *Hylop*, *Origenum*, or *Thyme*, or *Penroyal* hath been boyled) to prepare and purge grotz humours in an acute disease, but he commends it not for the want of a stomack. Lately the English found out a new composition of *Hydromel*, (they call it *Fari*) and serves better for ships than any Wine. The preparation is this. Take Barley tostrefied after the steeping in water, what you please, boil it long in 5, quarts of fountain water, till it taste well of the malt: 1 pound of this boyled with 8, pounds of honey, and 20 pounds of water, makes a drinck that tasteth so well, sweet,
tweer; and is most healthfull for use. It nourisheth well, is hardly corrupted, and keeps very long.

Hydromel of the Melissaers. Take of the decoction with Hops 2 pounds, purified honey squumed 1 pound and half, rolled bread trothed with the flour of malt, one piece; put all into a wooden vessel well covered, and place it near a floos, take away the froth that riseth, twice a day, with a wooden skimmer that hath holes in it; after 10 daies let it up in your cellar, after 14 daies drink it: They make it the same way in summer with fair waters, and made this way they drink it in winter, and when they desire to be drink. In Rus and English they call it Mede.

Dioecrius, it is called honeyed Wine. Puliux calls it Melicracion; Plantus, honeyed Wine, others call it Mullum. Arifinus was the first that brought this into Thracia, being taken with the incredible sweetness of Honey and Wine mingled together. Mullum made of honey of Heleneis, when it grows old, cannot be hurtful. Pliny. The new writers describe this potion thus; Take 1 gallon of the best Honey, 6 gallons of old Wine, Silt 3 ounces; it must then be skimed as it works, then put in the Salt, and seafon it with Amnific-feed, and roots of Elecampane let down into the vessel with a bag. The Egyptianis make it otherwise, namely of Raisins and Honeys which they call Melica, because it is of a very sweet taste. Oenomeli spiced. Take Pepper, paffh and dries, 8 copulles, Athenian Honey 1 sextarius, and 5 sextarii of old white Wine, mingl them, Celsus (as I remembre) and Cedins speak of it. Arridius is in the cure of the Sciatics. Also there is a kinde of Mullum which the Greeks call Kifth Kips, consisting of 36 ingredients, Gravus. May it be the same which Atheniuncas call was words. For woode is a drink made of Wine and Honey, and divers herbs mingled. Such as our Welsh men call Merfthin. The Irifh prepare a distilled Oenomeli made with Honey Wine and some herbs, which they call Ulphrebuch not unfit for a nation that feeds on flesh raw, or but half fed. Mullum made of sweet new Wine the Greek call Nectar; to new Wine aged, they add a tenth part of Honey, but this kinde is offensive to the stomach; and caufeth windines; it is given to purge the belly, Hippocrates calls it Melikedia, and Melichromas Galen notes. Athenius writes that another kinde, which was tame Nectar indeed, was wont to be made about Olympus a Mountain of Lydias, of Wine, Bees-combs, and sweet flowers. I take notice that Alexandrides did not think Nectar to be drink, but the meat of the gods. For he faith eat Nectar, chewing and mifling it, I drink Ambrosia. Yet Homer and the greatest part of the Poers took Nectar for drink. Dioscorides made Oenomeli thus, Take old Wine 2 Sextariis, the best Honey 1 Sextarius. Some that may drink it the sooner, boil honey with wine and strain it. Some for profit take to 6 sextariis of new wine working, add one of Honey, and when it hath works, they put it up in syell; for it remains sweet. The use of honied Wine is this: It is given in long. Fieavers that have weakened the stomach with crudities collected in it. It lootheth the belly gently, it provoketh urine, it cleanlefth the stomach, it is good for the diatase of the joyners, faults of the reins, a weak head, and to women that drink no wine, for it is pleasant in smell, and nourisheth the body. It moveth vomit drunk with oyle, and it is proficily given to them that have drunk poison; as also for such as are weak, and their phile is feeble; for such as are troubled with a cough, and a short breath, or impollute in the Lungs, and those that are walled with extreme sweating. But then it is for to mingle it with Hydromel. Alfo Galen prescribes to them Melicracion qualified with water, that have had a shaking fit not above a week, and nature being yet strong. Some there are that utterly condemn this in Feavers, but that must be understood of some times in Feavers, Romanus, a certain guest of Cesars, being asked how he had preferred the natural visage of his body and mind so long, (for he was above a hundred years old) he answered. Without oyle, with honey and wine sodden together, as Pulus did: That we may the more wonder at the use of Mullum, which the Ancients esteemed very much, for that they were persuaded that all acrmony of the minde, was pacified with sweet liquors, and the spirits made peaticle, the passages made softer and fater for transpiration, and that it was also phisick for manner. Plinus.

3. Oxynels, or honeyed Vignear is thus made, as Pulus thinks. Take honey 6 pound, old Vignear 5 Heminas Sea-falt 1 pound, rain-water (which Galen likes not of) 5 sextarii. It must all be made in cold the hot ten times, and then set in the Sun, till it grow itale, and Oxynel is made. But it lasts not above one year. All these, as also all made Wines are condemned by Themifon a chief writer. Galen prepares it thus. Let the beet honey be clarified, and add so much wine-vignear to it, that it may please the sick mans palate, boyle them till they are well mingled; and when you will use it, mingle as much water as you please: it is boiled enough when it needs more scum. Some there are perhaps that deliver these compositions somewhat otherwise, and Dioscorides he differs from Mifius, and Nicolius from them both. In Mifius you shall finde ten several forts of it; in Nicolius I have seen fourteen; some simple, some compound with Squills, Thyme, Flower de lace, and other herbs and roots.

Alfo Geyer brought in an Oxynel with Hellebore, which he commendes not a little in his Greek Epitile to Adolphus Otto. To make thin, thick and clammy humours, and to root them out; but especially to make way for intenfible tranflation, that is to draw forth from the centre to the superficies of the body. But you shall finde every where scattered in the Book of his Epitile, what force it hath against Melancholy, Cachetis, Dropitis, Epipetis, and Feavers, where also you have the Oxynels made with Hellebore, the great and the small.
4. Apomeli of Phlegreans in Aegina. Take white combs full of honey 1 pound, fountain water 3 pound and half; break the combs and press out the honey, boil this water and honey together, until the froth of it, and that which as it were the wax part, is taken off, and be by degrees taken off, when it is cool put it into a vessel. It cools lightly, as Galen saith, wherefore in Phlegreans and weariness in a Feavers it is very good. Avenius his Synop of Honey, seems to be the same with this, in Nicobucus you find there three kinds of Apomeli and in Actius Oros. Nourris Almarius yet more; for they are changed according to the nature of the diseases and th' sick patient, that is the reason that we had rather only touch upon them, then to describe them at large. It is drank all the summer to cool the body, at which time any man may drink of it, (especially when it grows too hot) it is held to be of a middle nature between a Mulsum and an Oxymel. Galen. It is also useful to expectorate with, to move urine, to purge the belly, and to cut thick humours. Aegintas Rustian.

5. Omphacemelis (which Graplicrius did not well translate Bitter honey) it is made of the juice of unripe grapes, 3 farrs, and 2 farrsiris of honey, boiled together, or till a running for 40 days; when it hath done working, put it in a vessel and stop it close, and keep it for your use. The same way almost is Melonemelis of Quinces made, Rhodonemelis of roses, honey of Myrtis, Rhoites, Rhodolacte, etc. you may finde there descriptions and use in Actius.

6. Thalassiumelis. is made of equal parts of sea-waters, rain-waters, and honey purified and see in the fun in a pitched vessel in the Dog-days; some to two parts of sea-waters add one part of honey, and so run it up. They both purge, but this hath far the left, Curatens: It is pleasant in taste and smell, it purgeth gently, without troubling the stomach at all. Pliny. And thus much of Honey drinks.

It would be too long for me, and tedious to the Reader, should I set down all kinde of Meats which the Athenians provided with honey, and other ingredients; therefore it shall not needfull to rehearse them; and it may be it is impossible: for divers Nations did variably mingle honey with other things, as with milk, meat, flour, wheat, cheeses, and with Salums, whence are these meats made of honey called 

- Avgos, Avgos, Avgos, Avgos, Avgos, Avgos. Juncates or honey-meats, and waters, they have divers names as the things is made. Athenians. They sacrified to Ceres this bread of felicity, as the Scholast upon Nicander theweth, we call it honey-bread. Also the Scripture teacheth, that the nations offered wafers made with honey to the Sun and Moon, and to the Queen of heaven: wherefore Moses forbid the Israelites to offer honey in their offerings unto God, Leviticus the 2. But it may be that was rather forbid the Jews because honey hath a power of fermenting. Also they made it with flax, fresh cheeses, oil and rufins; also to cause sleep, the Anciens made a kinde of meat of honey and poppy-seed, very pleasant, which they called Coecus, as Flitus reports. Also Amboyna which was held to be the meat of the gods, had that exceeding sweetness, whereby it was thought to be so healthful from honey, to make men immortal; of which Athenians and Bellonius write at large. But the Indians have the most and the moit wholesome juncates, who were held to be Barbarians, but the truth is, they may for their wit be compared with any in Europe, and for what I can see, to be preferred before them.

But before honey be used it must be clarified: which is thus performed: Take honey and fountain water distilled of each 2 pound, or as much as you please, boil them and skim off all that swims a top, till all the water be consumed. Then clarify it with 32 whites of Eggs. Abjomor. But if you make it hard pure, and faft together, mingle half a pound of the boil wine to one pound of honey thus clarified, boil them, skimming them till they grow hard, put it in a vial, and let it in boiling water, and it will grow clear, and flowy like sugar-candy. If honey be but mean, it will grow better by boiling: whether honey be sophiticate or pure, you shall know by burning it: for what is not sophiticate will burn purely, The Author of the GEnonion. But if you would separate the quinteulence of honey, oil, salt, water, vinegar, etc I face Belgis, the treasure of Encymynus and other Chymists, we will not venture into this ocean, being already plunged in the hubour. Now I shall shew you its first inventers.

Saturn was the first inventor of honey as Macrobeius and they of Cyrene boast. Calins and Pliny say that Arisbas first invented honey-works. But Diocles Nicolus writes, that the Creator of Cretes first found out the use and way of honey. Some ascribe this to the Thessalians. Others to Melius the most ancient King of the Greeks. Some to Bacchus, as Ovid testifieth. The Greeks feign, that a Nymph called Melitta first found out honey, and the use of it, and thence she had her Name given her from Bees, Who found it, or when, it is not much matter. It is a heavenly gift, and very profitable for men, if they use it well and wary.
Concerning Wax, Bee-glew, dregs of Wax, Pissoceros, Bees-bread, and of their Nature and Use.

WAX in Hebrew, Donagh; in Arabick, Mam, Examach, Zamach, Abers; in Greek, nuxem, neks, and µυκτης; in High Dutch, Wach; in English, Wax; in Brabant, Waf; in French, Cir; in Italian, Cera; in Spanish, Cera; it is either natural or artificial. Simple and natural Wax is the thickest part of the combs that contains the honey; and it is either virgin wax, or of a second sort; virgin wax is that the younger swarms of Bees make from the young branches of flowers. (That is the first Swarm put into a new Hive.) For, as Aristotle and Hel-lerius tell us, the Bee-masters call it, which they diligently separate from the first and new combs, as being by nature the most perfect of all: the second sort, though they reject not, yet is it short of the other for eeltem and worth. The way they make wax is this: They creep upon the flowers first with their fore-feet, and they touch them but lightly, then they wipe and rub themselves in the middle of them; then they nimbly and artificially lay down the tincture of the flowers which they have wrought with their water or moisture, and compacted between the legs of their hinder feet, and having gathered as much in quantity, and in form like a lentil, when they have this burden they carry it home to their houfes. That matter is of divers colours for the nature of the flowers, as yellow, red, pale, faffron coloured, white, black: which is the cause that the wax is of so many colours: they make wax, faith Pliny, of all flowers and plants, except forrebn and arach. Artificial wax, is that to which our labour and art must be used. Divers Authors use divers waxes to make wax. Palladins in the month of July, takes out the natural wax which he first prepares softly in a brafs vessel full of boiling water; cutting the combs small, and after that in other vellies he makes it up into forms, being melted, Pliny takes another way. The wax is made when the honey is prefit forth, but first they are cleansed with water, (that no reliques of honey remain) and they dries them three daies in the dark or in the shade. The fourth day, they melts them at the fire in a new earthen pot, the water covering them, and then he strains them through a basket; again the wax is boiled in the same pot and in the same water, and other cold water is put to it, so often as you see the vessels firened about with honey. Columella goes this way. After that the remainders of the combs are diligently washed with clear water, the honey having been firit well drained out, they are cast into a brafl'e pan, then he put water to them, and melted them at the fire, then he powed the wax through fihaw or nufnes to strain it, and then he boyled it again as he did before, and then putting water to it, he made it of what form he pleased, and when it grew hard it was easy to take it forth, because the wax hath water under it that will not let the wax flick to the forms. Now wax differs two waxes, for goodness and for use. The beet wax is collected by the principal Bees, and is fo wrought by the beet anthill; that it may appear white, tender, handsome, all like it felt, pure, somewhat fat, well firmed, without nerves or skins, brittle or any superfluous matter. Such as Nymus Marsullus describes out of Versa for Tarentine wax made by the Bees of Milicu. Wax is so much the nutr'de depraved, the farther it is from these good signs. The use of wax is twofold, for physicke or for other matters what concerns physicke: Wax is a mean between hot and moit, cold and dry, and emollient. It hath some gross parts, and that foop, it not only dries, but seems by accident tomoisten by hindering transpiration. Hence it is the matter of other medicaments. But by it self it digests lightly, being laid outwardly, for it hath a little delicious hot facutly, of which it partakes as much as honey doth. In drink it cures the dyfenterie, ten grains of wax swallowed fo big as millet seeds, will not suffer milk to clodder in Nuries breasts, Disferid, Aetius bids to give it in the bignest of three Tares. A certain Anonymus prescribes this remedy against pains of the head and malignant humours arising from a Fever or any other cause. Take virgin wax what you please, soften it at the fire that you may work it at your pleasure: lay it as a cap on the thorn head of the patient, and upon that put a linen cap that it fall not off. After three daies lay it off, or use it fo long till you finde the pain gone. Put wax into the hollow tooth that akes, and with a hot probc touch it, Archigenes. Wax applied to the nerves and tendons being bare, will cover them with flesh and cure them. Aetius. For the cold pain of the joysys, Take a cold dipt in melted wax, lay it handsonely and as closely on as the sick can endure it for one night, and it will cure it, Galenus. Moreover it is good to moisten the ears with Bees greese, and Bulls tallow, and melted wax, Marsullus. You may dipt combs in the eyelids with a fomerten of white wax, Gal. en Archigen. No man that is not an enemy of truth, will deny that oyl of wax is of principal use to cure pains of the Gout, to soften hard swellings, and to heal wounds and ulcers, Allo it is mingled as Galen with neffeth to the medicament of Afcopis against an Ozen, and it is a certain cure for the Jaundies. A certain Lady of most bleeded memory, wonderfully recommended the same pills to Gensyr. Take the yolk of an egg boiled hard, and as much wax, with some grains of faffron and a cup of worm-wood. Make pills to take morning and evening. They cure thrist exceedingly, but being continued by degrees without drink, they root out the diseafe. Allo a ball is made of wax to keep up the
womb subject to fall down; and medicaments made up with it will last the longer. Clesius the follower of \textit{Aeglepius}. The Greeks were wont to give the Cyrenian juice wrap it up in wax, to swell the bater. \textit{Celsius Aurel}. It is also the ground of all Ceers and Pluyfiers. \textit{Myritis} was the first that made a pluter without wax. It not only preserves the living, but it keeps the dead also from putrefaction, for which cause, as now it is used by us, to wrap up potatoes of great fortunes in wax (as Strabo reports the Persians were wont to do.). By a waxen probe hollow ulcers are best to be searched. The \textit{Carthaginiann} wax is the belt for medicaments; the next is the \textit{Ponwick}, which is very yellow, and smells like honey, being very pure. \textit{Pliny}. Which thing I wonder at amongst honey that is venomous: the third in extent is from \textit{Corice}, which is from abounding Bee-glew: the latter is the \textit{Corwick} wax, because it is collected from box, it is thought to have a proper quality.

Now follows the use of \textit{Wax} otherwise. They that are rich, or sick, or great men desire their candles to be made of it; by reason of the sweet smell. Also the use of wax is not small in stuffing the chinks in vessels; for rents in the camp to keep our rain; for bed-ricks that the teachers not out; to join pipes made of reeds as \textit{Oval} fan concerning the shepherds of old.

And with the Reed will waxed they play'd and sang.

Also the most excellent Painters painted with waxes as \textit{Pliny} reports, and they adorned ships with it. This kind of painting though it were not hurt by fire; nor by the wind yet it was lost we know not how; when \textit{Aetius Primogenius} and \textit{Zenusa} died. Also the \textit{Apennines} were wont to inter over their writing tables with wax before they were interred, as \textit{Josephus} describes it.

And \textit{Bee-glew} in his Epitile to \textit{Trogus}. I like by the bees, there was no hunting pale or hence by me, but a style and writing tables; I did meditate and let down some things that though I should have my hands empty, my writing tables might be full. Hence proceeded those old forms of speaking. In the fifth, second, third, or last wax. \textit{For Sestius} proves that the Romans write their Testaments in wax; in the life of \textit{Cesare} in these words. He made \textit{Petric} his heir to the last thing, the rest be placed in the bottom of the wax, that is in the last part of his will. Nor is the use of sealing wax little, whereby we seal letters and instruments. Of this there are four principal kinds the \textit{Ponwick} or white, the red of \textit{Indians}, the black of \textit{Americans} the yellow or \textit{European}. The \textit{Ponwick} is made thus. The yellow wax is often laid in the open air, then they boil it in fresh water, adding Nitre to it: then with skimmers they take off the flower of the wax and they pour it into a vessel that hath a little cold water in it; then they boil it apart in fresh water, then they cool the vessel. This is done thrice and they then dry it on a run-dry hurdle by day and by night in the open air, for this makes it white, the honey being drawn forth by the Sun, and the yellow colour breathed forth: when it is dried they melt it, when it is melted they cover it with a thin cloth, and let it in the sun, after it hath stood in the sun it becomes exceeding white, being boiled once more. Wax is made white otherwise, but this is the most proper for medicaments. \textit{Pliny}. I see that the Greeks speak of it no other than which \textit{Pliny} calls the \textit{Ponwick wax}. \textit{Attius} speaks of white wax in the \textit{Unguent Maritimus} and \textit{Panus} speaks of it also. Black wax is either natural as in the \textit{Molucca} Islands, and many parts of America it is gathered by the Bees themselves (as we read in \textit{Thesis} and in the Centuries of \textit{Navigations}) or artificial, adding the ashes of paper. \textit{Red wax} or like Minum of \textit{India} is made with mingling Anchusa or Cinnabar. There is another kind of red wax, hardly like a stone, but effe to break, the Merchants think their letters sealed with this to be very sure: yet there are some knaves so cunning that they will open them and that them again not hurting them, that no man can possibly discern it; which art, though a chief Impoctor pleased to \textit{Ponus} when he was at \textit{Paris}; yet he was too honest to reveal it to this mischievous age. The \textit{European} honey is of the natural colour, that is, yellow. But the colour and variety of things hath to bewitch us, that we are not content with natural colours, but we must imitate the \textit{Ponwick}, \textit{Indians} and \textit{American} waxes and above those we must have green, dark lights, blocks of wax of Holland casting on the same and some Turpentine.

\textit{Propolis} the Aramians call \textit{Kar}, the Greeks call it \textit{opismus}, \textit{oxiphum}, \textit{xylophum}, \textit{Dyphum}, the Germans \textit{Vorflughe} with the Dutch \textit{Vorflughe} with the Dutch; the Hevelrians, (as I mistake not) \textit{Bet}, and \textit{Binnentrost}; the English \textit{Hive-drofs}; the Spaniards \textit{El vinum de los colonnes}. \textit{Scribinius} takes it for \textit{Virgin wax}: \textit{Sylvanien} call it for the dregs of the Hives. \textit{Arendus} call it the forke of the walls, and fayes that some abuse it for \textit{Bedellium}. Some maintain that \textit{Propolis} drops from trees, othe say it is the first comb. It is indeed a thicker yellow wax with firmness sweeter tasted, like to \textit{Nestor} and distill like Maltick, like to wax but not yet made wax whereby all pottage are fill against cold and rain. The third force is that black matter and it is called \textit{Cocium} which \textit{Majalis} calls \textit{Mincus} and \textit{Pliny} call it \textit{Cocinum}, the dregs of wax: the second is called \textit{Pissocereus} as you would say, it is a matter of pitch and wax. The third \textit{Propolis} is a middle nature between these two supporters and wax, laid very thick at the mouthes of the Hives, chiefly in summer; and therefore it is called \textit{Propolis} as you would say belonging to the sun-shine. Because the Bees build with it at the doors before the Hive. \textit{Propolis} (from \textit{Hipers out of \textit{Pliny}}) perhaps is some resin gum growing upon the budding places of trees, which Bees gather and hang about the entrances of their Hives, to stop all chinks in winter against the cold. There are four sorts of it. The first is collected only out of the black Poppy, which they call \textit{Argyricum}, that is, yellow; it
is full to be touched, and sticks like bird-lime; it stings sweet, and comfortable to the head, caueth
rems, and is like Storax, it taints like Poplar buds. The second is gathered from the Birch-trees, and is
of a colour between a yellow, sith, and green, it is full and dextrous in handling. The third the
Bees make out of the gum of the Poplar tree, called Alpins, but it is but foreign, and only in
those places, where no other Poplar tree or Birch abounds, but only that is called Alpins. The
fourth or mingled, is gathered and confounded from all these trees, so that he hath a mixt colour
fent, savour, and content. Cardus faith almost so much; now let us hear Pliny. Pliny says, Propolis
is a kinde of middle substance between honey and wax; gather between wax and Philocreos, and
it seems to be gum collected by the Bees to stop up their hives. Rondeletius faith, it hath a
thick substance, and the smell of leaven. Pliny faith, it stims so strong that some use it for Gal-
banum. But in the spring gathering time of honey, this part that thrusts their cells may be separated,
which Politian writes thus: That the Bee lays a white foundation of his various coloured wax,
so that Propolis seems to be a thick foundation for the wax. But it is now out of use, nor
can any man finde pure Propolis. For most Bee-masters taking out the Hives, when all the hon-
ney is run out; whatsoever is in the combs they mingle together, and keep none pure by itself;
but that wax which Avien calls black Mum, any thing but the dregs of the combs, or effe of
sediment that sinks to the bottom of the water after the wax is boiled, and this is now Propo-
lis: but Propolis is not pure, but some mingled matter. The nature of Propolis, is to dissolve
in oil as wax, but it is more ponderous and thick, and sinks to the bottom of it being melted,
when wax swains on the top. Choose the sweeter, purest, not so sophisticated with wax, which you
may easily part by pouring it into water. The best Propolis is said to be pure, most fragrant,
without wax. That of Cretes and Paphis is the most effectual, the Bees collect the greatest part
of it from the uncouthy of Storax and Libdanum; they collect it questionless out of other
plants: for they make Propolis where neither the Poplar tree, nor Birch, nor any of the forestal
plants grow. Great is the virtue of pure Propolis, upon the gross spirits, and it draws faulty mat-
er out from the depth. Holleriis. It is of the nature of wax; but it powerfully draws forth Dio-
ferid Cells placed it in the number of biting remedies, saying that it digests and moves mat-
er out. Actius fays that it heats, diffuses, ripens, cleanses, attracts. The cleansing force is not very strong, the attracting is strong enough, it is of thin parts, it papers in the heart.
the depth quite, or in the beginning of the third: you must first often it with your hands be-
fore you mingle it with other medicaments, and then taking the reft from the fire, it heats it in
and boil it, for it will not well endure any boiling at the fire. It draws out thorns and all splinters
that are within. Actius. Varro faiths, that for its manifold uses it was fold dearer in the marke
than honey. May be therefore Propolis was called holy wax, because of Via Beer, where they
fold it at Rome, as Longus writes in the cures of hard swellings. They draw forth thorns and such
bodies lurking in the Heels, with runnels, (especially of a Hair) powder of Frankincense, and Propo-
lis. Pliny. It helps an old cough with its smell. It cures the rowe with waters and roots our ring-
worms by anointing them. Dioscorid. It cures Oczana: Scraio. Pliny l. 11. 6. 7. tells of more
of its Physical uses.

Arifatole calls Eristhaca Senderuzza, others call it Cerintherum, and Smirion. l. 2. Arifet, de Planit.
The learned call it Venulage, some from the time of the year, Vereux; this Glen, faith Nephus
the country Lombards call Capvina, but ours Taranum. It is the meet the Bees make, which they
lay in the void spaces of their combs; it calls bitter, it is made of spring dew, the heart of trees,
and sometimes of gum. That of Africa is fullest little; that from the South parts is blacker; from
the North is better and redder; there is much from the Greater Nuts. Vercules faith it is a
flower, that thovers the future harvett. Plin. Varro faith, it is not nearly but glee, whereby the
Bees fillen their combs at the ends togethe. It forcibly calls forth the swarms: where they
would have the warme lights, they anoint a bough with Erithaw, or any other place, adding balm,
Virgili, I think, following Varros, calls it glew. Mytisscommothes (Stephanus calls it souse) and Pif-
tes, cures stokes and ulcers. Arifote. What use it hath in the hives, we saide enough before.

CHAP. VII.

Of Drones and Theevies.

The Drone called in Latin, Fucus, is called in Greek, λαυόνος and ἱππόλαυς in the Illyrian
tongue, Cuspa; in English, a Drone; in High Dutch, Tros; in Low Dutch, Belonder
straal; in Spanish, Zangano; in Italian, Acbe non fa melo; in French, Bourdon and Fouillon; in the
Hungarian tongue, Her; in the Polonian, Cszew. The word Fucus a Drone, is derived as
some think from Fury, which signifies a thief, because privily and by stealth he makes prey upon
the honey: although with more probability the word fucus may be so used, because he doth cheat
and conten the Bees; and under colour of keeping the Hives warm, (which is his office to do) he
ranstick the combs. And for that reason, some with too much confidence, perhaps, derive the La-
tine word fucus from the Greek word ἱππόλαυς signifying to eat or devour; others will have it
come a favendo, in regard of their sitting upon, and murtling up the young swarm.

Some
Some make the Drone to be a fourth sort of Bees, but not so well as others think, because he neither gathers honey himself, nor doth any way help in the working or making of it up. He is almost twice as big as the ordinary Bees, and somewhat bigger also than the Thief; he is as big likewise as the King, and somewhat bigger. Although they do not arrive at this copulency by the dispensation of nature, but by their course of life that they take. For when the Bee does not set apart cells for the Drones to breed in, they make them lefser then their own, And the little Scha- dows or worms whereof they come are far lefser than those of the Bees (who are sprung of the noble race, and of the flock of the Bees) in their first birth; which at length become a great deal bigger than the Bees, both by reason they never take any pains whereby to spend their natural furnitures; and also in regard that they do nothing night and day but (like even at the fall) never leave gazing and gorging themselves with honey, which afterwards they deadly pay for, when provision happens to be short, and there falls out a death. They have a bright flour, but mixt with more black than that of the Bees, in bulk they exceed them all, but yet without sting and idle. They both breed and live amongt the Bees, and when they go abroad, they presently tread all abroad aloft in the air, as if driven by violence, where for a while they behin, and afterwards set upon the Bees with good stomachs, falling greedily to the honey. But why the Drone should equalize the chief Bees in dignities, and the Bees also in having flings as well as they, let us hear Aristotes reason. Nature did before faith he, to put a difference between them, that they should not be all of one kind, which is impossible; for so the whole Stock would be either Kings or Drones. The Bees therefore are like unto the Kings, the Master-Bees in strength, and in the faculty of generation; and the Drones only in bulk or bigness of body, to whom if you should give a sting also, they would be nothing inferior to the Kings themselves, 1. 3. c. 10.

They are called also of the Greeks νήσοί, because they hide their stings. From hence Hesiod, hath these words, ἱππος ἀνάρχον τῆς μακραίης ἀλότριος, who lives idly, having strength like the Drone that never wethers his stings; certainly either they have no stings, or never use it to revenge themselves withal. Pleasurably plain they have none, and terms them no other then in a manner imperfect Bees, and therefore Virgil calleth them ignavum pecus a sluggish kind of creature.

Solids calls them νήσοι, μεγάλοι ἡς ἡ ἐνὶ σφων ἠγείρει, from hiding their stings. Columnella, a sort of creatures of a greater growth, very like the Bees, and accordingly he placeth them in the rank of herding or swarming creatures. They suffer egregiously of the whole swarm many times, not only for their floth and rapacity; but for that wanting a sting they seem effeminate, and not able to make any opposition. Plin. l. 11. c. 17. describeth them thus: The Drone is an imperfect Bee without a sting; and begat then after all when the Bee is decayed with labours, not being able to labour any longer. Like as men part their labours, and thriken in age, beger of women when they have well-nigh left reeming through age and weaknes, feeble children, incapable of procreation, little better then eunuchs: to it may not seem strange, how these Drones are too weak and impotent, being begotten of the Bees when they are exhausted with age and labour, in whom they are not either to propagate their one species, nor to take pains as the other do. Which is the reason why the Bees so lord it over them, for they put them first forth to work, & if they loyter, they punish them without mercy. For in the moneth of June, two or three (especially the younger fry) drop out one Drone by himself alone, buffer him with their wings, goe him with their stings, if he resist them, they call him down from the form upon the ground, and at length when they have made him weary of his life for anguish, they make an end of him and kill him; thus beheld with mine eyes, nor without exceeding admiration and delight. Sometimes the Drones being banished from the Hive, are fain to remain without doors, not daring to enter. Now for these reasons especially thereunto moving, the Bees do that out the Drones: either when their number is above measure increased; or when there is not room enough left for the Bees to work in, or else when their honey fails, and they are straitened for want of provision.

And as they bear a deadly hatred against the Drones, so neither will they hurt any man if with his naked hands he shall take the Drones and cast them forth, no although they be in fight. The Drones, if the King be alive, (as some affirm) are begotten in a place by themselves. But if the King be dead, they are begotten of the Bees in their cells, and those are a great deal luster than the other, in which regard they are said to have a sting in their souls, although they are allowed none in their bodies by nature. Thus Aelian. lib. 1. de Animal. Hist. c. 10. The Drone which is bred amongst the Bees, lies hid all day between the honey cells; but in the night when he observes that the Bees are gone to their rest and are fast asleep, he feets upon their works and presys upon their Hives. This afoon as they understand (for that most of the Bees being weary with labour fall asleep, and some few watch) when they espie the thief, they moderately and gently chastifie him, crop his wings, thrust him out from thence and banish him. But not content with this punishment, whereby to amend his fault, being naturally poftfet with two ill qualities, idlenefs and luxury, he hides himself amongst the combs. But afoon as the Bees are gone forth to pasture, presently he falls upon the works, doth as much as in him lies, gives himself with honey, and utterly ransacks the sweet treasury of the Bees. They coming home again from feeding, as soon as they meet with him, no more favour him as before, with saife frites; or as if they were about only to banish him again, but feting upon him with their stings they wound the felon,
felon, and no more satisfy themselves with chiding of him, but then he pays for his voracity and glutony with no less than his life. This the Bee-masters lay and persuade me that it is true.

Drones come forth without a King, the Bees never. For they always descend from Kings. There are that affirm that the young Drones are brought thither from other places from the flowers of honey-tuckles, or of the olive or reed: But this opinion is in thin, and doth not stand with reason. Aristotle affirms that the great store both of Drones and Theeves are sprung of the longer and slender kinds of Bees, which doublely he was informed of by the ancient Philosopher, or by Bee-keepers, and Honey-masters of his time. Some likewise say they are ingendred of pure affection; as of Mules to Jactrata; of Alces to Cardiunt; of Hones, to Plutarch and Servius. Others will have them to be the issue of Bees by a certain degeneration, when they have lost their wings, for then they become Drones, nor are observed to gather any honey, and being as it were gelt of their natural strength, they neither do harm or good. Others on the contrary say, that the Bees are bred of the Drones, because long experience hath taught, that as the number of Drones aboundeth, so much every year is the number of the Swarms greater. But that in my apprehension is rather a reason than a solid reason: for therefore are there not (as some reasonable years it comes to pass) more Swarms of Bees, because more Drones are bred; but rather on the contrary, because the increase of Bees is more in regard of the clemency of the heavens, and the plenty of mellowish dews, from the abundance of superfluous moisture proceed the greater store of Drones; as the Philosopher hath well collected. Or if we grant them this, that the more the Drones are every year, to the more Bees; yet notwithstanding we ought not to conclude from thence, that the Bees should derive their original of being to the Drones, but rather be HOLDING and indebted to them for their conservation, while they at the time of sitting and incubation, by their company do much further the procreation of the Bees; the throng of them (to use the words of Pliny) exceedingly encouraging the vegetative heat, by which they are sooner hatched up.

There are that divide the Drones into Male and Female, and will have them to propagate their species by way of copulation, although (as Athenæus writes) neither Drone nor Bee were ever seen to couple together. Yet forasmuch as Wasps and Bumble Bees, and all other Hverigeus, are seen sometime (though very seldom) to couple: I see no reason why the modesty of the Bee and of the Drone, whereby they abandon publick unction and venery, should debar them of the private use of copulation. For they, as the chaffier sort of men are wont, do it privately, and do naturally deduce the impudence of those that publickly prostitute themselves in the day time, and when all eyes are upon them.

We have told you before in the generation of Bees, that some would make the Bees the male, and the Drones the female.

But when as (about the time of making their honey) they do so sharply punish them after they have call them out of their Hives, and kill them (such violence which if used to their mothers, would much blenish the virtues of the Bees) I r barely think they are females.

Of what use then are they of the Hives? Is the Drone altogether unprofitable, good for no thing, idle, without things fit for no service, no way helpful to the publick? More than that, Virgil himself chants it to that effect:

Immunifig sedens aliena ad publca mucus.

The Drone sits free feeding on others food.

Where Pollux takes the word in that sense for a slothful, idle, unprofitable creature, void of all employment, unless it be that of thieves and robbers, who take such a course that either they will live by the sweat of others' browses, or else they will disturb the whole Kingdom. Such like Hesiod makes women to be, when he compares them to Drones.

*Omen* est facile invenire, in omnibus libris.

*Anno* invenitur, scilicet in sale et in aqua.

Which is, I interpret it in Latin thus:

 Qui segetes suscitat contrectia adibus attet;
Sudaem altius prope putatur in aereum.

Or in English thus:

Who sit at home, and to work have no will,
With others sweat they do their bellies fill.

But more creditable Authors propound divers uses of Drones: for if there be but a few of them amongst the Bees, they make them more diligent and careful in their businesse, nor by their example, (for they live perpetually idle) but because they take the more pains in making honey, that they may be able to continue their liberality to strangers. They discover also signs whereby to know when the honey is come to maturity: for when they have perfected their honey,
The Theater of Insects: or, Book I.

Chapter 1

The Drone, when he perceives that the Bees are in their dead sleep, he sets upon their works and destroys their comb.

But yet (if Earth-humane deceive us not) they are not unbusied neither; but they build houses for the Kings, large and magnificent in the top and middle part of the Hive very finely covered over. They are therefore idle (to say fly with Aristotile) in regard of making honey or gathering dew; but in regard of their Architecture 'tis they are workmen. For as the Bees make the combs of the Drones hard by the Kings Courts, so under the same consideration the Drones build the Kings houses, which is the reason why they and their young ones (if they have any) are sustained by the Bees. The cells of the Drones now grown up according to the bulk of their bodies are larger, but their combs lette; for the Bees built these, but tho' they made themselves; because it is not fitting that the same proportion of food should be allowed to hinder and hibernate as to the child en or matters of the family.

Tzetze in his elegant Poem, and other of the Greek Poets, make them to be the Bees carlanor water-bearers, and do align unto them a moist kindly heat whereby they are said to hatch the young Bees and make them thrive. In like manner Columella: the Drones do very much help to breed the young Bees, by setting upon those feeds out of which they are made. And the wise they are more familiarly admitted to the nursery to bring up and cherish the young brood, when they have done, afterwards they are shut out of doors. And Pliny also in his 11. Book. They do not affit the Bees in their Architecture only, but also in cherishing their young, the multitude of them cauing heat and warmth, which the greater it is (unless the honey chance to fail in the mean time) the more the swarmes of Bees are increased. To conclude, unlike they had been for some great use for the Bees, Almighty God had never houled them under one roof, nor made them, as it were, free Deniomes of the same City. Neither would the Bees lay hands on them at all as enemies of the State, but when their service multitude doth increase and they take up offensive arms; or scanty of provision were to be suddenly expected: in which rempelt of affairs who would not rather judge that the Carpenter should be dilluted than the Ploughman? especially when without him by reason of want of victuals, we may hazard our lives, but the other we may be without for a time; without prejudice to our lives, and our selves (if need require) are able to build habitations every one for himself. Now as thebe, being but a competent number of them, are very profitable to the Bees, so if they be over many, Plato not without cause terms them morbus alveariaum, the Pest or Plague of the Hive, in the 8. book of the Common-wealth (where you may see a molt elegant companion between Aristotle and the Drone) both because they will the provision of the labouring Bees, as also with their too much heat ruffle them. This inconvenience the Author of the Gepoponics doth thus remedy; take the covers of the Hives and sprinkle them on the inside over night with water, and you shall finde them benrises in the morning when you take off the cover of the Hives again, all over covered with the Drones; for when their bellies are full of honey, they are very thirsty all day, and perspire with an intolerable desire of water; so that the thing left to the lid of the Hive; and it is an ease matter to put them all to death, or if you will rather to take away the greatest part of them. But if you take away the young ones and all, that are not yet come to have wings, and pluck off their heads, casting the bodies in again to the other Bees, you shall offer to them a very dainty dish.

Moreover also if you shall take the Drone and crop off his wings and cast it back into the Hive, he will if we may credit Pliny pull off all the wings of the rest lib. 27. c. 11. or rather the Bees themselves will devour the wings of the rest of the Drones that are left. For so faith Aristote, πόνος scivere το κτήνος αὐτοχρόνος δομής, ἀλλ' ἀσωτήτης τούτῳ τούτῳ ἐπημένω. For it is not probable that either: the Bees should crop one the others wings; or that the Drones should so far adventure, or be able to offer such violence to the Bees: so that as Pliny was mistaken in reading for ἀριστέας, so also they do not a little speak by gueffe, who refer the words ἀριστέας, the refi. to the Bees and not to the Drones.

But what the dreaming of Drones doth pottend, what use they may be of in the way of Hieroglyphicks: let Apomafarius out of the Schools of the Persians and Egyptians declare. It shall abundantly satisfy for what we intended to speak of them, to shew their true use, true nature, generation, degeneration, description and name. But as for what belongs to Emblemes and Hieroglyphicks, and precepts for Manners; every mean capacity may furnish himself with a world of useful rules by oberving their course of life; without any need of confuting with those abfinre Egyptian Priefs.

The Theeves are thought to be amongst the Bees of a kinde by themselves that are very big and black, bigger in belly than the profitable Bees and leffer than the Drone. So called because they devour the honey by theft. Bees admit of the Drone into their company, and are glad of it as being helpful to them, for their benefit sometimes. But the Theeves being naturally odious to the Bees, lay upon their labours when they are abroad, waiting and spoiling their provision of honey. Yea they do to glut themselves in the mean while, that they are not able many times to get our again they are so full, or to stand in their own defence; whereupon the Bees at their return without any more ado, severely punish them, and according to their just demerits kill
Chap. VIII.

Of Wasps.

The Wasp is called in Hebrew, Teṛyna; in Chaldean, Dihrane; in Syriack, Gnargnisha; in Arabick, Zambr; in English, a Wasp; in Dutch, Harselt; in Italian, Vespa, Werep, Moscone; in French, Guefpe; in Spanish, Vespa and Abispa; Gothick, Boulgringle; in Slavonica, Vola; Ulyrick, Ofa; Hungarick, Dara; in Latin, Vespa.

They are called Vespas, as Caius writes, for that in the evening they seek about for flies to feed on.

The Greeks also have several names for them; commonly they are called φασμα, Eustathius derives φασμα ἐκ τῆς φασάς, because you may perceive them to be divided in the middle that they seem to gape, as you may observe in the figure set down. The Scholiast of Nicander calls them οὐονοζοντες, of Sunaes, Abislas, and Abislas; Hesychius terms them διάβαλλος and ανθτός Ψαλικα, (but abusively) θαθονα, for they ought to be called rather Crabrons.

Now the Wasp is a winged Insect, grecial or hurstound round like a ring, long, having four wings (of which the two former are the bigger) having a wing within, fix rooted, they have no blood, they are of a yellow golden colour upon black spots placed trianually, the whole body is garnished with divers colours athwary; when it may be folt, it is called Seuraphy.

I think they all in general are armed with stings, (what ever Authors write that their Females are without stings) because when I was at Ham, a village town in the West, about the year 1587, having found an entire Wasp net, I poured hot water upon all the females and killed them, and yet could find none that had not a sting either within their bodies, or sticking out.

The body of the Wasp is bound in the middle, but the breast with a certain exceeding thin thred, that they seem to have no lungs at all, and to be quite through open; whereupon that Greek Comick Poet calls those of the Mayexternal, (which Terence by way of elegance calls Butttnes) for their slenderesse, in the words sponaw, waftpy or like Wasps. They make a buzzing noise also like the Bee, but more loud and hoarse, especially when they are angry; upon which came that proverb made by Theocritus in Hadespolis, in comparaison of a bowling idiot, or man of learning and parts, who may thus waris i.e. The buzzing Wasp against the Golf hopper.

If you will have the endowments of his minde described, he is a political and flocking of great creature, subject to Monarchy, laborious, a lover of his young, and a lover of his neighbours; his minde and of a very quireseome disposition, and very proper to choler. It is a sign that their life is Political, because they live not solitary, but do build themselves a city eminent for structure, in which they are subject to their set laws, and do yield to them as well in their external actions, as in affectiones. Whereupon he Philosopher doth rightly reckon them in the number of the City. This is Political form of Insects, they are governed also by Kingsy power, not tyranny (as Ed Tunis) although by nature very fierce, making his Argument, because Captains of the Wasp, want stings; if they have any, they never put them forth or strike with them. And although they be twice as big and hard above all the rest, yet are they not without gentleness, and graceful demeanour, with which also sometimes they refrain, and appear their rebellious and mutinous subjects.

But of their mutual love one towards another, every man is able to give a testimony; who ever he be that shall offer injury to any one of them near home, for with his buzzing and making
making a noyse, all the swarm being terrified issue out to the succour of their neighbour; and will cause the troublesome stranger, although armed, to run away (as they did the Phædrites of old) of whom Achilles reports that by the multitude and fierceness of the Wasps they were quite beaten out of the City.

As for unnatural affeil to their young, that it is a vice which is very far from their disposition and nature, as many things do evince, to that above all, that with more than Herodick undauntedness of courage, they let upon those that would surprize them; neither do they stand in fear of either Neoptolemus, or Hellen or Achilles or Agamemnon, the General of all the Grecian Forces; yet that divine Poet Homer in the 13. of his Iliads, when he would expell the generous spirits of the Grecian Commanders, he compares them to a speckled Wasp, and endow'd with the Wasps animosity and часто heartedness, when they are put upon it to fight for their house and family. They do moreover care for their children large firms; (as it were like those Manes of the Egyptians) of a round form, flooted, and standing one on the top of the other. One of these fabrics most curiously built, was brought to Pirius when he was at Belium out of a certain solitary grove. There were seven stories of building one on the top of the other two fingers space between each of them, disposed by the putting of certain columns or pillars between them, that there might be a convenient space left to paffe in and out of their lodgings. The diameter of the orbs up to the fifth story about twelve fingers over all the other from the fifth are narrowed up to the top by degrees, so that the left is about five or six fingers broad. The greater round contains the fifth room, fenced to the bough of an old tree, very well fenced above with a certain rough-calf to keep off all wind and weather. Within are six square cells standing very thick together; but the middle concamcations the multitude of wasps had filled, a very thin leaf being laid over every hole for a covering; some of which when Pirius had taken away he observed all those chambers to be full of Wasps creeping with their heads to the bottom of them. Those in the rooms below were certain imperfect things like Embryons or little worms, which were covered over with the same covering, as it were a winter. Ofter, in expectation of the more milde season of the spring. Which building although it seemed a very sharp winter did remain entire, and no way decayed; at length Pirius expediting what should be done with those little worms when the spring came, he perceived nature to make no further progress in her work with them.

But still the fabric was kept by him, not without the great admiration of those that saw it, wondering much to see so much art and cunning in those little creatures, and that they were able to hold out to finish such an elaborate edifice. This reluates Pirius. I also have seen many fuch, but of a different fashion, some like a Harp, some like a Cup, some like a Pear, some like a Toadstool, some like a Botte.

The matter of their Combs is said to be confused, heaped up together, like bark or cobwebs, transparent, gummy, and made into very thin places like leaf-gold; but I found it alway light like paper, dry, easily put with faint and thither by the wind, and for the most part growing up from the bottom like a Turban. As for the place where they use to build, it is thought to be divers. If their chieftain be desirous they make their nests aloft in the hollow places of trees or walls, and in thefe as some affirm (though I never could finde any) they make wax also. But if they have their matfer Wasp, they build under ground in fix square cells according to the number of their families, and after the fashion of the Bees. Their combs are made in the form of a large Toadstool, round, out of which there comes out in the middle or center as it were a little foot by which the cell is fastened to the tree, or to the earth, or to another cell.

But so tender are they over their mates or females, that they will neither suffer them to take any pains, nor to seek after any provision; but they themselves bring in all necessaries to them, and do as it were enjoin them to keep at home.

All which things, and each particular being considered by any man, he must needs confess the pain, industriousness, sweat, and labour of the Wasp. As for their choler and frowndielle of the Wasps, not only poultery that scrape in their nests and trouble them, but in like manner all that provokes them do know them to be implacable: from whence arose the proverb of the speech of the Greeks, and is ever since, to wit, to be a relation, as the other says, to be a relation, i. e. to contrast with a Wasp's nest. Of which sort something to that purpose was written on the Tomb of Hippocrates and the words "Wasp's nest in mine ear," i. e. Do not raise a steeping Wasp. And to Aristophanes in Veipsi; when he would express a cruel, morose, fretful, quarrelsome sort of people, calls them Wasp's nests, &c. Clem. Alexander also, when he would set forth the acerbity and bitterness of those vices that Ivo in wait for the souls of men, faith, vespæ parvis habitant, i. e. These specially pleasure, are hardly Olympick Antagonists, and more than Wasp's nest. To which may be added a certain speech of Themistius discourting of the speeches of many malevolent adversaries, ἢ κατά (fate he) ἢ κατά τοῦτον καὶ ἐπὶ τὸν ἄνθρωπον: they raised upon me as it had been a swarm of stinging Wasp. Which oftentimes proves mortal, as Phrynius knew by experience from the Milephas and the Phædrites were sufficiently inflicted by their own great miseries; yes, whoever he be that shall challenge this generous and redoubled Champion into the field (so use Nicander's words) shall obtain but Cadmus conquest, he shall firely be worsted and flain; for they do not fight to much with their stings as with the strength of their bodies; and more than that, when they fight they will never give over being not only strong but resolute.
Notwithstanding they differ in their original, kind, sex, age, place, diet, and labour.

Ibidem affirms that Wafps come out of the purified carcasses of Flies, although he may be mistaken for all agree that the Scarabees are procreated from them: rather am I of opinion with Pliny I. 13. c. 20, and the Greek Authors, that they are sprung from the dead bodies of Horses; for a Horse is a valuable and warlike creature, hence is that verse frequently, and commonly used amongst the Greeks.

Whips come of Horses: Bees from Bulls are bred.

And indeed their more then ordinary swiftness, and their sagacity in flight, are sufficient arguments that they can take their original from no other creature (much less lice from an Aflse, Hair, or Oxe) since Nature never granted to any creatures else, to excell both in swiftness, and valor, and surely that I may give another sense of that of Proverb of Aristoph. Xan. 22. and Num. 23. 7. and 8.

Hail the daughters of the wing-footed seed: this would I suppose fit to be spoken in way of jest and scorn to looking women, which do imitate the haininess and rowdward disposition of the Wasp. Other sorts of them are produced out of the pured corps of the Crocodiles, if Horses and the Egyptians be to be believed: for which reason when they mean a Wasp they let it forth by an Horie or Crocodile, Nicander gives them the name Butonans, because they sometimes come from the dead carcasses of Wolves.

Helenaeus & Vincentius lay that Wafps come out of the putrefaction of an old Deers head, flying sometimmes out at the eyes sometimes out of the nostrils. From Lib. 2. as Hericus seems to have collected this observation: that out of the corruption of every creature, there is another sort produced, which would be very absurd; For by this means Generation would be infinite, and likewise daily experience doth teach the contrary.

For that little beast which I term Tainwan Alberts, doth naturally produce nothing at all, as I have tried a thousand times.

There are those also, that affirm that Wafps are begotten of the earth and rottenness of some kinds of fruits; as Alcmenus, and the Aristobulus Scholiast: but for the most part they are begotten by copulation, and the mutual embraces of the male and female; which although Aristobulus I. 8. dito: affirms, he seems as fabulous, yet when as the Philosopher affirms that he saw it with his eyes (as I. 1. de gen. anim. c. 10 & 9, Hipp. c. 41. it is evident) I am wholly of his opinion, and do give full suffrage to his attention. But how after copulation, they grow and come to maturity, we may know of Arist. Hipp. 9. c. 41. and Pliny his interpreter. The mate Wafps, when they have chosen them a convenient place, under grounds in the chinks of walls or (which I have often seen) in the thachat of bowles; in the beginning of Summer they make their nefts and they contrive their little nefts or cells (which the Greeks call Thanares) with 4 doors or passages in which are begotten worms only, not Wafps which when they are grown up then they make larger cells, and when they come to have young ones then they make more nefts so that at the latter end of Autumn, you have many and large nefts builded; in which the chiefest or master Wasp (which is called the Matrix) procreates no more Waps, but those of her own sex; which also are begotten alof in the uppermost part of the neft, in the likeness of mowants. But when they are in four or more cells continued, or penned one to another, thewske of wafers would be no difference in their breeding, between the Master or mother part, and the ordinary Wasp. They let fall their sperm at the Bee doth at the sides of the cells of the comb, and on these close to the walls or outmost part. It is not at all alike in all cells, nor of equal dints, in the same place, 11. c. 11. and 12. equall and frangis (fayth Pliny.) In some so big that they are able to fly: in others only Nymphs, covered with a thin membrane like an Aurelia; some also have them yet in the worm. The Worms only have excretion in like manner as the Bees have. Their sperm or spawn doth not stir at all whiles it is in the Nymph, and is covered with a membrane. In the same time of the year, and the same very day you shall observe them to be of unequal growth, one flies abroad, another is only a Nymph; one is able to vole or tumble, another not able to stir, a third is a little worm. All these things happen in the Autumn, not in the Spring. They must increase at the time of the full Moon. Hee then is to be noted, that the Waps have no winges and that all the Summer they are goved ned by their Matters or male Waps; but in the Winter by their females. Afterwards the multitude of their illue being renewed, the government such as it is, of short continuance and weak, however, upheld with molt juft lawes, returns to the male. But yet notwithstanding their young seemes not to be brought forth by way of Birth, [sich Arist.] because it prevetly comes bigger then a Wasp should be able to bring forth. A very little and empty conceit of so renowned a Philosopher. For what should hinder that Nature should not be able as quickly to perfect and increase that which is produced by a legitimate birth, as that which is generated of putrefaction? Let us but call to minde the young ones of fowles, which in a very short time when they are once out of the shell-do get feathers on their backs; how soon do they go, feed, grow, and come to maturity? and then we shall easily see the weakness and improbability of the Philosopher's Argument. The Matter Waps are greatly increased in numbers, especially if there were great store of Waps, and a wet year the year before.
they have layed their young fry, they cover the cell with a kind of a little thin skin as it were, which when they come to perfection they break, and two days after fly about with wings. Aride

fate mentions but two kindes of Wafps, one milde, the other fierce; the fierce kindes is very rare, and breed in mountains and woods; and breeds not under the ground, but in an oak, being greater, more stretched out, blacker, longer, having a stronger sting, and thinfeth more fiercely than the milder do, and is armed with a greater sting than his body seems to be able to carry, Aride faith that they live till they be two years old, and when the tree is lost in the winter they are seen to fly away. They lye close all the winter, and most commonly live in old walls or trees.

A fort of these I found once in a wood in Essex, not without great peril of my life, at such time as by chance I carelessly wandered here and there a sampling, with my friend Penny and one servant attending us. I would needs be prying into their nest: with which they being offended, all the swarm flew out upon us with all the force they had, and but (as God would have it) we had carried in our hands some sprigs of Broom, (with which we used to catch those Insects) for our safeguard and defence, we had payed for our folly, not only with the hazard of safety but of our lives; for the followed us hard to the very middle of the wood, and a great while it was before they would leave pursuing us.

In the year 1681, on the top of Chartmell hills amongst the flones I saw two forts of Wafps very eagerly fighting with one another no difference there was but in bignefs. The greater they stood upon their strength, the les trifled in their faction and multitude; for six of the leftr fought with one of the greater, not in the air, but in the grasse. From whence I gather that the greater did use to rob the leftr of their honey or young ones, or perchance offer them some other injury. Long and sharp was the fight, till that scarce after two or three whole hours was over, and the Sun very vehemently shining and torturing them, did give over. For they are very hot upon revenge, and long ere they take up the quartc: so boldly and furiously charging the enemy, that even Mars himselfe were not able to answer them, or march their valour; such a strong undaunted nature hath God infilled into them, and such spiritlike courage hath Nature planted in them. I once received from Vienna and Hungry two kindes of Wafps, such as you see in the Figure, their backs were variously coloured, with a shining yellow black colour, the one had rough horns, the other smooth; both of them almost three times as big as the ordinary fort of Wafps.

The Wafps called Ichneumones are lessthen the rest: they kill Spiders called Phalangia, and after they have done they carry them into their nests, and dab them over with dirt, and so sitting upon them do procreate their own species, Aride. Therefore they are called Ichneumones faith Niphus from their fragrants and flendemants.

This kind of Wasp I make to be all one with that spoken of before, building her nest in mudwalls, and such like places; before the entry or going into her hole she makes a porche of dirt, the length of it about the breadth of two fingers, which within is embattled over; with smooth platter of the same dirt. Pseudophexa leemeth also to be a kind of Wasp having no stings, with a blackhead horse, having two cornicles or little short horns, great eyes, black, standing out of its head, a long forked mouth, a bulky breast fluttering out, to which on either side are three feet softened, the shoulders thick and bunching out, the body long, slender, confiling of many joynts, two dusky coloured wings, rough feet, and of the same colour with the wings. There is a kind of Wasp called Liest, because it stings deadly, like the Pifmire to called. Paramera are a kind of Wasp tho' called, (as Aride faiths) with earth grapes, (as Aride faiths) and serves for a prey to the Owls and Sceetche-owls, as Aride faith.

Of the Wafps as well wilde as tame, some have no stings, (or at least make use of none) others have; the leftr and more feeble are those that want, which neither are able to offend or dash. On the other side, they that have stings, are bigger, stronger, and able to fight. These, some would have to be the Males, the other that have no stings Females. Also very many of them that have stings are conceived to lose them upon the approach of winter. But this as yet hath not been my chance to see (faith the Philosopher). If you take a Wasp and hold him up and make him busy, those that have not stings do presently flock to him, which those that have do not; which is the argument whereby some are to prove, the one to be male, the other female. Of both forts some are observed to couple together as the fly doth. Moreover, (according to their sex) both kindes of them are divided into two forts, either they are male Wafps, or drudges and labouring Wafps; the one is greater and more gentile, the other less and more pettif. The drudge or labouring Wasp doth not live out a whole year.
Chap. 9. Of lesser living Creatures.

year; for in the midst of winter they all die, which is seen, because soon as winter comes they grow fluid, and in winter there are none to be seen: the others, that is to say, the Lady Wafps, are observed to hide themselves all the winter long underground. For divers men when they have gone to plow or dig in the winter, have seen them, though no man ever saw the other.

Now the Female Wasp is broader, weightier, thicker and bigger than the Male Wafps; and but a flow of flight; for by reason of the weight of her body she is not able to fly far; by which it comes to pass that they for the most part stay at home, making of a certain glutinous material which the labouring Wafps bring to them, combs and cells.

No man ever observed these creatures to live long, for the longest lived, which are the Mar- trices; female of Lady Wafps, live not above two years at the most, the other die every Autumn. Now whether no the Female Wafps of the former year, after they have brought forth another brood of males: Wafps die together with the young Wafps, or whether it always fall out to be so, or whether or no they can possibly live any longer time; many Authors leave undetermined. But the wild Wasp is accounted to be longer lived than the tame, the reason is because those making their nests commonly by the highway side (from whence they are called by Hom. i. e. Highway dwellers) are necessarily exposed to divers injuries, which hasten them to their death. And yet that little time that they live, is made up in the strength of it. For if you take them off the head, and to again at the breast, they will continue a great while after, and putting forth their wings, will as steadily hurt any man that shall touch them as if they never had been pulled in sundry, or were alive as before. Guilerinus in his book of Shell-fish, writes very confidentially that they put off their shells and renew their old age every year: certainly (unless he dreams waking what he would have to be) this must needs be discovered sometime or other: in their Nests.

Apollinaris calls them oculos, Aris. l. 11. c. 52. 20000, although they feed not Their Food, on raw flesh only and ripe Apples, but upon Pears, Prunes, Grapes, Flowers, and sundry sorts of fruits; also on the sap of Elms, Sugars, Honey, and almost whatever. They feed on flesh of Serpents, and then they fling mortally. They hunt after the greater Flyers, and fare not the harmless Bees, who do so well deserve of the Common-wealth of mankind.

According to the nature of the place they live in, they differ both in shape of body and diet. The places of position of minde; the trivial and ordinary Wasp being accounted to the company of men and Wafps, cartel, do seem to be more milde of nature; but those that live in woods and solitudes are more fierce; yes, in much that Narcissus in one word calls them. *sagacious, i.e. pernicilus, pere- nichus, and destructive. There are also, as Ovidius affirms in hotter Regions, those that are more hurtful then others, as in the West-Indies, whereas they differ from those of these both in big noses and shape, so also in their venome. For to are they reported to be far more deadly then the English, French, or Spanish or Barbary Wafps: such as these also, Olus Magnus in his 22 Book, faiths, are very frequent in some very cold countries.

The use of benefit of Wafps is observed to be divers; for besides that they serve for food for The use of the Catheters, Martins, Swallows, Owls, Badgers, Chameleons, they are also many wares profitable Wafps, to men; for they kill Phalangium the most venomous kind of Spider, and they themselves are a platter for their own stings. The Pseudophyic or wild Wasp (especially that which is taken in the beginning of that year) being taken into the left hand and there held fast, Pliny commendeth for an excellent remedy against the Cholera; and obser- ver, in the comest water of common Wafps, or decocted, for raising a tumor in the place that is with it; applied to the belly it makes it swell as if it had the Dropis, by which trick whereunto use to persuade their sweethearts that they are with child by them; and by this way also they deceive many times very cunning and expert midwives. Mirradi. Mem. cent. 7. from which it may be concluded that their venome is exceeding hot and inflamative.

The Fox also (a subtile creature) is said to prey upon the Wafps, on this manner; he purs his tail into the Wafps nest so long till it be all covered with Wafps, which he eying, pulls it out and bears them against the next stone or tree he meets withall till they be all dead, this being done again and again till all the Wafps be destroyed, he feares upon their combs and devours them. Astan.

But men harass and destroy them with other cunning. As thus, in the mean time that the labouring or working Wafps flee to the Elm, which is said to be in the Solstice or at Midsummer, to gather some gums material to work withall: the matter Wafps remain in the Nest and sit up on their young, thoe they smother with the flaming vapour of Sulphur, Garlick, Reed, or such like; and throwing down their combs kill them with hunger. Now when they would preserve their Bees from being surplied by the Wafps, they set by the Hives side a pot with some little pieces of flesh in it: into which when the Wafps in hope of prey are entered, they swallow the lid of the pot upon them and kill them; or else putting hot water in at a hole fced them to death. Others hang a net before their Nests over a small Menow. Now the Wafps being drawn by a natural and strange sympathy to the Menow (for no food more takes them than that) they are presently involved in the net, and会计 caught, and with casting on hot water are killed.

Astan. As also they lightly spur out of their mouths oy, upon the grapes, fruits, sugars, honey,
honey, etc. which causeth them either to fly away, or rafting the oyl, to die; sometimes they mingle corrosives with honey (as Mercury sublimed, Vitriol, Opiomines etc.) which when they take, eates out their bowels, and so they pay well for their glutony and incontinence.

Now if at any time by reason of the stinging of Wasps, there arise pain, perturbation, swelling, redness, heat, nauceoufnes, and thirst; and not long after swelling (which happens when they have poifoned their wings with feeding on venemous herbs, and Serpenes ftry) Physicians have found out a prefervative and remedy whereby to repel their wings and easily cure them. The virtue of Mallowes, and Marfe-mallowes is excellent againft the stinging of Wasps. Thus the most foft and tender hec becomes a remedy against the moft warlike and injurious creature, with whom whole juice and a little oyl mingled with it, and the part anointed, doth either mitigate the rage of the Wasp, or doth not fuffer the stinging to enter, Plin. l. 22. c. 179. So Aetim the Wasp, faith he, will not come near any man that is anointed with Mallowes; for as a foft aniverfity appeareth with it, and as the Greeks use to apply ιοκείον ογκον οιράν γας, etc. A mild reply is the bell alay or auger: to alfo in phyficks we fee fothe things that are moft suffe and myeyling, to be reixed and beaten off with the moft foft things, as the Iron with lead, the Admift with blowds, the flings of Wasps, Hornets, Bees, with oyl and the juice of Mallowes. What is more foft than the eilk-worm? which yer Aetim affirmed being beaten together with oyl and the party anointed with it, is a prefervative against the stinging of Wasps, the fame doth the Locust and the herb Balm beaten together with oyl, if the Greeks may be credite. The flone Comarides if it be the true, although dawbed over with honey, and bred about doth fray away all Flyes and Wasps whatsoever; as Sylvaticus out of Albertus doth conjecture. The like virtue doth Marisbuls adscribe superstitiously and too confidently, to the Iron that hath the figure of the shell-fish Strombus graven in it.

The symptoms that follow upon the stinging of Wasps, are faid to be thefe; they fuffer all alike as thofe that are flung with Bees, to wit, pain, pittif, swelling, but the pain is more grievous and of longer continuance, especially if they chance to be flung by the citron coloured greater Wasps, in afeinwy and tender place, for then follows the cramp, weakness of knees, swelling, and sometimes death.

Physicians have found out many remedies against the stinging of Wasps; we shall first speak of thofe we have tried and which may challenge your acceptance, being confirmed by long experience. We finde that Wasps applied to the wound they make do exceedingly help them, being perfidiously to use them by Gilbert an English man. It may be that not the Scorpion only hath this virtue, but the greatest part of Insects have it alfo, if we should make trial diligently. But if any man be flung by venomed Wasps, (which is easily known by the wound of the part, by raving and swelling, and coldness of the extreme parts) then give antidoares against venome, and open the place with a knife, or rather lay on a cautick; when it is laid open and dilated ftruck it forcibly, and taking some of the earth of the Wafps neft, make a plaifer with vinegar, and lay it on the fore. Alfo a Cataplain made of Mallowes, Willowes and Wafps combs helps wonderfully, as we proved by the counsel of Halyabbas. The North English man make a good plaifer againft the stinging of Wafps, of the earth of furnaces, vinegar and flyes heads; it is worth its weight in gold. Rub the place with juice of Citrals, and let the patient drink Marjoram fecd 2 drams: or take juice of Marjoram 2 ounces, bole Armoniack 2 drams, with juice of Owre Grapes what may fuffice, make a plaifer. Another; anoint the place with the juice of Purflain or Bees, or with sweet Wine and oyl of Rofes, or Cowes bloud, alfo with feed of Wilde Ceterneys bruifed with Wine. Galen. Barley meal with Virgare is good; mixt of the Pig-tree dropt into the wound. Wine or aru-water to foment the wound; give in drink 4 drams, or the tender leaves of the Bay-tree in fharp Wine, which alfo will do much goold in a fomentation. Alfo drink the decoction of Marfe-mallowes with Pofca: apply Salt and Calves fat. Mallowes with Pofca is a principal remedy. Dise-ved. l. 2. c. 42. Arminjons an earth named Gominola to thefe, and Clay, and One-dump, and Sefum, and many other things with Pofca. Oyl of Bayes draws out the poftion of the fling of a Wasp. Leaves of Marfe-mallowes bruifed and rubbing oncure the veneome of Wafps. Drink a little meafeure of the juice of Ruc or of Balm, with Wine: and the leaves eaten, and applied with Salt and Honey, or boyled with Virgare and Picry, are very good. Water-mints, Rofermartys with Barley-meal and Pofca juice of Ivy-leaves, Golden flowers, and Owles bloud, are excellent againit the stings of Wafps. Pliny l. 32. c. 9. Galen praifeth Water-mints, and if it is drank, and Cerarvum, if at the fame time you lay on Oxone dung for a plaifer. Lib. de fmpicibus ad Partheniam, & lib. de Centaur. ad Papium. A branch of the wilde Palmuets, Endoove roots, and all wilde Betony, laid on for a plaifer, profit very much. Alfo drink wilde Betony 2 drams with Oymel. First, fuck out the poftion, then hold the part hurt in hot water for an hour, then feep it suddenly in Vinegar and Hif pickle, to the pain is prefently gone, and the swelling finks away, and the veneome is pacified. One half dram of Marjoram feed applied fills the pain, or 3 poglobs of dry Coriander feed or cool juice drank. Avicenna. Leaves of Nightshade or Houfelerick laid on are good. Alfo bole Armoniack with Camphire and Vinagar, Nuts bruifed with a little Vinegar and Caftoreum: apply a honey comb, and prefently hold the part affected to the fire, or put hot afhes under it, and the pain will ceafe forthwith. It is good to lay on green Coriander, or oyl and afhes mingled. Rhap. Savoyr or Water-mints applied, and the feed of them drank; or the juice of the lefle Centory drank in Wine is excellent, So are the leaves of river Beafs Mercury.
**CHAP. IX.**

**Of Hornets and the Tentbredo.**

The Greeks call them *δειπνος καὶ δειπνός* because with their sting they raise a Carbuncle. They are called in Late *Crabrones*, perchance from the Village *Craba* in the Country of *Tucfum*, (where there are great stores of them) or from the word *Caballius*; i.e. a Horse, who is said to be their father. According to that of *Ouid. Met. 15.*

The warlike Horse, if buried under ground, shortly a brood of Hornets will be found.

*Albertus* calls it a yellow Bee. *Cardanus* will needs have them to arise from the dead Mule. *Plutarch* in the life of *Cleomenes*, saith they come out of Horfe flesh, as the Bees do out of the Oxe his paunch. Now whereas they are more melancholy and fullen then the Wafps, why should I not with *Virgil* say that they are produced of the Afe? whom we have seen not only to fight with the Horfe, (when as the female or the Afe would be back) but also to chafe and overcome him often times. I conceive that those are produced of the harder flesh of the Horfe, and the Wafps of the more tender flesh.

The Hornet is twice as big as the Wasp, and very like it in shape; they have four wings. Their De-whereof the two undermoft are twice as little as the upper or outermoft, the which are fattered with fibres to the shoulders, being of a dark brown and Cheature colour, and with which they fly very swiftly. Six feet they have of the same colour with their breaste and shoulders, their head long, of a yellow hewe; their eyes hanging out in fashion like a half Moon, between which grow two horns like a fickle or reaping-hook of the same colour with the feet. The belly is made fat to the shoulders with a small thread; of which the one half is of a duskie colour, and begin with a girdle of Saffron colour: the other half seems to be all Saffron colour, set with five dark colour specks, together with a small triangle, laying moreover on both sides of them certain joynts, by which they can contract or extend themselves at pleasure. On both sides of the belly they have four black spots, and their tayle is armed with a long, stiff, and exceeding venomous sting. As they fly they make a murmuring and humming noise, far more horrie than the Wasp. Who notwithstanding they are great hearing creatures, are fierce and choleric, and alwayes of a wilde nature; nor (like wilde plants) do they admit of any coming: of such malignity are they that with
twenty seven strokes they will kill a Man, or a Horse, especially in the Dog-days, at which time their nature is more hot; and men are more weak by reason of the abundant exhalation of the spirits. No wonder then that in sacred Writ they are compared to most cruel enemies, Exod. 23, 28, So Ovid. Metamorph. 11, Spicula Crabream: argentam the fiery darts of the Wasp. And Virgil in the 4 of his Georgics calls them afterimma very sharp. Terence in his Phormio: Plantus in his Amphitryon says that Proverbs. Iritari Crabrems, I have fluttered up a Hornet, to shew the nature of women when they are angry, the more you strive with them, the more you provoke them, and at length go by the worst. Now as amongst Bees both the Drones and the Kings or Master-bees have no stings, and also some Wasps, (as we have said before) so amongst the Hornets there is not one but hath, both those that are in trees and those that are in the ground; not so much as the Captain or Master Hornet but hath one. For the Hornets as well as the Bees and Wasps have their Commanders or Master Hornets, what ever Pliny l. 21, c. 11, dreamt to the contrary; only they are bigger than the rest according to the proportion of Hornets to Hornets, then Wasps are to Wasps, or Bees to Bees. They do also remain within doors as the Wasps do, but they never breed but one Master Hornet of them in a Nest, for fear of tumults and taking of parties; but as they are very troublesome, and fatal to those that from without annoy them and seek to spoil them, so they are very strict in preserving domelick peace and quiet, and in keeping of mutual society one with another, and in providing for their young they do even outstrip the Bees themselves; for they never quarrel about priority of place, nor distract them with diversity of employments, nor make a stir or tumult about the election of their Chieftain or Master Hornet, but all have one and the same employment, and they all diet together, whatsoever prey they take, or small creature they kill abroad, they carry part of it home to theirfellows, and young ones.

Neither do they every year send out and expose to the wide world their young ones as the Bees do (and for which they are cenured as in that respect unnatural) to finde out an harbour where they can for themselves to dwell in: but all their new brood they nourish and bring up in their own bosome, and as need shall require build more and bigger nests to keep them in. As for their King or Master Hornet (whom also they dearly love and respect) such a one they have that doth appear not to want power to command, but occasion to exercise it. Only he excels the rest in courage and minde and bigness of body (as it is usual for Princes to do) for he is more fierce than any of the rest when he is to encounter with forien enemies; as he is on the other hand most mild and gentle to his subiects at home.

The Hornets make their nests under ground: casting up the mould as the Pismires do. For neither they nor the Wasps send out young swarms as the Bees do (as is before said) but as the young are bred there they remain, and so they dig their nests bigger and bigger, as the family grows greater and greater. They make their nests exceeding large; we took 3 or 4 baskets full of combs of the latter brood: they have very little or no honey in their cells; a drop or so of what their young are.

If any of them chance to wander from their nests they gather themselves together into some tree, and there make their combs in the top, which oftentimes are caife to be seen, in which they procreate one or more Hornets, when he is grown up, leads away the whole troop and provides them a nest with himself.

The wood or wilder Hornet (as Pliny) live in hollow trees all the winter, like other Insects they lie hid, they live not above two years. Their stinging is feldom without a fever, causat carcinoma tumors, and exceeding great pain. They build their Nests far more artificially than either the Bee or Wasp, sometimes in the hollow trunks of trees, or else under their roots in the ground, which they make bigger and bigger according to their family increaseth, and curiously plaster over with a kinde of flimy spittle gathered from gummy leaves. The mouths or pabbage of their cells are never upward, but altogether downward, and they very providently place the bottom of their cells upwards, that the rain may not pierce through them, or left otherwise they should be expoed to the extremity of wind and weather were the head above. All their nests in a manner are exctly 6 square, the front or outside whereof is beter with white and rusty iron coloured segments; the maker of them is membranous, much like pieces of Beech-bark, when it is roll'd together and shrivel'd up with heat. Whilet Peninus was at Peterborough in England, he saw in the wide and open street a Hornet pursing a Sparrow, whom when he wounded with his sting he fell down dead to the ground, and with the admiration of all that beheld them, he stuck 't out and fill'd himself with the blood of the fain prey.

Concerning the Copulation of Hornets Arist knew nothing of certainty, as neither from whence nor how they are bred. But for as much as they do for certain lay their young at the very sides of their cells, as Bees and Wasps do, it should seem after the same manner they bring them forth. But if they do couple, they do it in the night, as Cats do, or in some secret
cret places, out of all possibility of being seen; where Argus himself should not espie them.

The Hornet doth not feed on flowers, but lives for the most part on flesh: and rather than fail, oftentimes they will fly to dung and excrements. They hunt after grater flies also and the smaller birds, which when they take, they first wound the head as the Hawk doth, and then pluck it off and fly away with the rest of the body. In the winter they die many of them: because they do not as the Bee, lay up provision beforehand, but only live from hand to mouth, regarding nothing but their present necessity, Aris. 1. 5. Hist. Moreover, as Landau observes, they watch about the Bee Hives, and getting on their backs use them in stead of a Couch or Chair to carry them; for when the poor wretches strive to fly away, they carry a most cruel rider on their backs, who when he hath suckt out all the juice that is in the Bees' body, is the most contemptible of all winged creatures: he kills and eats up him which supplied his hunger. Also all sweet things whatsoever the Hornet will feed on: so much that I have seen him with mine own eyes to eat of grate worms. But the Indian Hornets have such a vast appetite (as Ovidius wittelly) that they will light upon Oyl, Butter, Cakes, Sawce, and all liquid things whatsoever; not spiring napkins or table-clothes, which they will Confecrate and defile with their filthy excrement, and laying of their slimy eggs. Now as they feed upon what they got from others, so they do not want one to prey upon them likewise. Above the rest the Brock, who about the full of the Moon enters their dens or nests and destroys both house and family. Nor are they food for this useful creature only, but they serve the courtiersmen by way of provolick, to forethrew the alteration of weather; for if toward the evening they are seen to fly about in greater store then ordinarily they are wont to do, it is a sign that the next day will be fair and hot: but if about twilight they often enter into their nests as it were to hide and shelter themselves, then expect rain, winds, and stormy weather to ensue. Upon which Avius thus:

So when you see troops of beasts Hornet fly,
Late at the end of Autumn, they foretell,
When first Virgilius flies the evening skies,
That storms at sea shall presently ensue.

Moreover whereas the same Medicines that cure the flinging of Wasp, will prevail also against the flinging of Hornets: yet as Aggregator hath taught us, a Hornet is the Bezoar stone for its own wound laid on with Oyl, Oys, or Ose dung; also Bole, and all fat earths are commended, such as Bacchus applied to bald Sileus, who was stung with Hornets, whilst he rifièd their nest for honey supposing they were Bees: Ovid describes it near in 3 Taxtor:

Thousands of Hornets his bale part torment,
And with their stings they wound his ugly face,
He falls and cries for help, a foul disgrace;
What remedy it was to late for to repose.

When that the Satyrs came, & found poor Sileus,
His face all sores, and basting on his knee,
They could not choose but laugh, Bacchus said thus,
Nor was it with Mud it prov'd a remedy.

He that desires more remedies against the stinging of the Hornet, may finde of them plenty in the story of the Wasp. For Authors do seem to make them all one, only with this difference, that in this case they ought to be given in greater quantity, and the use and application of them longer continued.

Now let us proceed to the Insect called Tenthredo,

Whether it ought to be called ἁρπαγος, ἀρπαγος, & ἄρπαγος according to Arisbalet, or ἀρπαγος according to Nicander let Philosophers judge; they seem to me to differ only in name and bigness. For whereas the Scholast of Nicander calls it ἰστυμφόλος, an Insect like a Wasp, I do not weigh that, when as ever and anon, by Poetical licence, he calls the Wasp, ἀπερ ζευγαριον, a yellow Bee. What name it hath in other nations I know not, and (to say the truth) nor know I the little Beast itself. Only this I finde, that Authors describe it to be in colour like a Wasp, like a Bee in bulk or bigness, and in communication of labour like all other social winged Insects. He is very saucy, loves the kitchen well and fits, innumerable that some think it should be written ἀρπαγος in stead of ἀρπαγος. But because it is given so much to Licorishelle, Hesychius calls it ἀρπαγος ὑματια, a wood or wild Bee. Hermodorus thinks they should rather be called ἀρπαγος; or ἀμμαργος rather than ἀρπαγος, as he faith it is corruptly read in Arisbalet: He makes his nests in the ground as the Wasp doth, with many rooms very large and liadomne. Pemnius will not by any means yield that the Pemphredo should be the same with Tenthredo. For the Pemphredo (as the Scholast of Nicander describeth it) εἶναι το κεραυνόν μελισσον, and ἀρπαγος ὑματια, i.e. the Pemphredo is very like a Wasp; but the Tenthredo like the Wasp. But yet notwithstanding the Scholast forgets himself; who writes also of the Pemphredo after this manner: Pemphydred a is Insect like a Wasp, it hath a sting, it is greater than a Pimibre, but less than a Bee; it hath wings, and a various colour reding to black; in fair weather it gathers suftenance from the shrubs in the valleys, then it flies and lades it up in the hollow oaks.

This Insect haunteth woods and mountains, gathers honey juice from flowers, and layeth it up
in a hollow oak as being his Repository for the fulfillment of his life: but honey he makes not, wherefore they differ in no other thing but in bigness; rightly termed of the Poet, Parumula Pemphredo, i.e. a small Pemphredo: as degenerating only and especially by that mark from the Tenthredo. Of winged Primires, we shall speak in the Chapter of Ants. And this shall be sufficient hint here to be spoken of winged Insects, such as are social and live together. Now we shall bend our discourse to speak of winged solitary Insects, or such as live severally by themselves.

Amongst these solitary ones, some there are that have nests, as the young Drone called Sirens, the Drone called Bombylus, and the Bombyx; others that have no nests, as the Fly, the Gnat, the Butterfly the Moth, the flying Glow-worm. Those that build nests, are the Sirens of both kinds, so-called by Enychus, in Enychus tam nomen, i.e. because they seem to have a kind of articulate or significant voice, or perhaps as that for Monsters, and the Sirens, because with his pleasing noise and buzzing he doth as it were tickle and charm the ear; and not unfitly and to alio, because they best and flutter in the air with their wings.

Of the Sirens there are two sorts, the one leafe all of a dusky colour; the other bigger black mix with other colours. This sort Penius refers to the species of the Wafl, and he describes it in his drafts. All the body black, except the back, which is reddish from the middle almost to the tail, the extremity of which being black, hath silver coloured wings affixed, the former twice as big as the other: they harbour in woods, and in the brinks of ditches, and ruinous buildings; whether they have any flying, or I know not.

The Bombyx is so called from the silver colour, because they never flye but they whirle and turn round in their flight: whence the Greeks call Toppes or Wheels, Βομβυξ. It is a creature resembling the Wafl, of a black hue, having a silver like as the Wafl hath; but flitting so deadly, and with such force; that it leaves the weapon in the wound. As a remedy to this Nicander commends the Pine tree Gum, and the unctuous honey of the Tenthredo. Parmen in his Iambics makes mention of this creature, which in the time of vintage are used to eat the ripe Grapes. Another of this sort is found in Alphus, but of greater bulk. Some of them build their nests spire wise out of clay like to glass or fall, fastening them to a stone or such like things but so hard and thick that you can scarce pierce them with a dart. For these they lay and bring forth little white worms, covered over with a black membrane; in another membrane they make wax in clay, much paler in colour and in greater plenty than the Bees. So Aribote and Pliny. Who indeed were very sparing in their relations concerning the Tenthredo, Bombix, and Humble Bee; either because their nature was not so well known to the generality of the Grecians, or rather because they themselves were not so well vers'd in their History.

The Bombylus greatest of the nesting Insects, is bigger than either of the Sirens (spoken of before) he hath his name from the humming noisy he makes: for the word Bombyx signifieth as much, to make a humming or buzzing noise: for which cause he is called by the Germans Hummel or Humblin, in English a Humble Bee, as you would say a founding Bee, the name being taken from the noisy they make: from whence (as the learned Turpin notes) the long pipes are called Bombiles from the humming found they give.

Polius calls thee motricinis, and Theophrasus cals a reed fit for these kinds of pipes BeautifulSoup.

They are of little or no use. Infamous that the Greeks use to call an idle unprofitable man, Βομβυκλος, i.e. a man no better than a Humble Bee; for such is this kinde of Bee, even of no use at all. Nevertheless one Antichristos to shew his wit, hath taken a great deal of pains to set forth the commendations of it. A cup with a wide mouth making a great noise as they drank, was in great requit with the Ancients; that so, not only the brain but the intestines might be intoxicated with the liquor, but the ears also with the great noise of the noise. They breed under stones hard to the ground; they build their nests sometimes with two doors, sometimes with three; in which there is found a beginning of a certain course Honey; and that (as Albertus relates, and Pernis says) not of any great quantity; who once found so much as he could scarce hold in three handfuls. The English Humble Bees have not all things, only some few of them, but those that have do ring grievously; the honey they make is not so sweet, and will all some water wafhe.

They gather their wax as the Bees do to their hinder legs: they couple tail to tail, in the mean while holding fast by some plant or tree, they continue long in the act of venery, and all the time clapping with their wings they make a harsh noise, as if they were singing a Bridal song.

CHAP.

CHAP. X.

Of Flies.

In Hebrew, Zebub; in Atabick, Babnon Aidaubel; in Illyrian, Minfcha; in Spanish and Italian, Mofca; in French, Mofche; in High Dutch, Flieg nuck; in Low Dutch, Uitzeg mugge; in English, a Fly, from flying or scampering away; for it signifies both in Scotish, Fleé; in Greek, μύκα, and το πτηνόν, that is, to fly deeply, or to murrise, the Fly doth both. Latin, Mufca.

Nor as proceeding from Muscas Mofis as some do fondly dream, but from Muscas a mufcle; for taking off his wings you shall see that his head is full of fineness, his body foit, his tail teni discord. Hence the diminutive mufcula in Boëthius, who thus elegantly cries out. Quid hominimbeccolius quem morfas muscularum necas? What to frail as man whom the smallest Fly is able to bite to death?

Now the frame both of its body and minde we describe thus out of Lucian and others. The Description, great Fly is the leaf of winged Insects, inmuch that it may be compared to the leafy Fly or Fleé; only he is so much bigger than they, as the Bee is bigger than he.

It hath wings, not ruch as other things that flye haves, but made of little skins as the Locusts, Graffhoppers and Bees are, but a very great deal softer, as an Indian Garment is fower than that of Greece. If any man observe the Fly when he opens his wings in the Sun, he may perceive them painted with variety of colours, as the Peacocks are. He doth not flee straight forwards, as the Bane do; nor skipping as the Locusts, or making a noyle as the VWilp; but winding in and out to what part of the air ever he pleareth to move himself. Neither doth he flee quietly and in silence but with singing and melody; nor to hard hearted and cruel as the great or little Flies, not as Bees and Wilps with a grave harfinkle, making a horrible and terrible murmuring yeas for far doth the Fly exceed all these in sweetness of sound as he lieth, as the small Pipe doth the Trumpet and Cymbäl, or as still mufick is sweeter then loud.

He hath a very little head bound to his neck turning every way, not compafted and fastened to his shoulders as the Locusts is. His eyes stand out very much, shining as if set in horn. His breast is very firm and well compafted. He hath his feet growing out of his body, not as the Wilps fast bound or tyed to it; he goeth only with four of them, the other two so emost serve in head of hands; as you see him commonly go upon four feet, in the other two holding up something or other that he hath gotten to feed on to his mouth as men do, and as we do. His belly is ferner answerable to his breasts, having b road girdles and fakes, He doth not sting with a fling as the Bee and the Wilp do, but with his mouth and fhout like the Elephant, and he ears and taketh up things with his mouth and flicking in a concave vefel he holds it in the top of his mouth: out of this comes forth a tooth, with which he picks or bites: he drinks nothing but milk and blood; that which he draws through of his flings with very little or no pain at all, but only with a kind of titillation or tickling. The lights like Truth, he doth exceedingly rejoice in, and doth behave himself honestly therein and civilly. Yea the Fly doth covet the light, that many times with the Spider or Spinner he ftooth his life for his pains; at night he goes to reit (as honest folk use to do) and makes no noise. He doth nothing in the dark, counting it unbecoming for him to do any thing privately, or to be guilty of that act which if done in the light would be a disgrace and dispaftement to him. I can alfo use it you is no little understanding that he hath also; whereby he doth eate the wiles of his treacherous enemys, the Spider; for he marks him as he lies in wait for him and looks upon him, and do declines his force lef he be taken in his net, and be destroyed. I must not fpeak of his provenle and valours, for in that he may feem to fue-pallie man himself. Honor the Prince of Poets, when he did endeavour to fay forth and commend the gallantry of the bravest noble man, doth not compare his strength to that of the Lion, Leopard, wilde Bear or the like, but to the undaunted courage and confidence of the Fly. Who although he be never so opulent and bearten off comes on again, and bites as close as he did before: yea such a strength he hath with him, that he will not wound the skin of a man only, but of an Ox or Horse; yea the Elephant also when he gets between the wrinkles of his skin, will thwartly ex him, and according to the bignesse of his finet gath and wound him: when he bites, 'tis not out of necessity or clownifhnefs to get blood only, but by way of love & humanity, & for that reason especially he feareth upon the fairest: yea what a pretty thing it is to fe a company of Flies flying to and again playing and sporting one with another, and hinging upon a thread as it were dancers on the topes. Moreover as the cleanly borne doth, the laies her orde all in one place, so that upper winde and foiling of the rooms where they ufe are all full of great spots which they make on that occasion, which is an argument that they are not altogether void of some kinde of memory alfo. T-cssiathe moreover, that such is their love to thoef of their own kinde, that they bury their dead companions. These doth as much diſcommunity them as Lucian commends them: and he inveighs against their procacy and faucines; which is such, that being driven away never so often, they notwithstanding return with ftreth affaunts. He blames them likewise for their impudence, in that they couple in publique, and know no end of their Venery almoft; neither do they as the Cock, when he once hath trodden presently falls off, but is born upon the
back of the female a long white, and the carries him; they fly away together into the air, yet are they not unfound with flight. Learned Pennius caught two Flies in the Acts, and shut them up in a box, and the next day he found them together still in the same posture; which doth much confirm what Arifli, Aelian, and Niphon say, to wit, that Flies do continue very long in the act of generation. Plutarch faith that the Moule and the Fly are indolent and unteachable creatures, who although they use the company of men daily; are by no means tamed, neither do they shew the least courtesie, or the least show of a grateful mind for what they receive of any man: both of these are by nature very fupicious, always fearful of treachery, afraid to be caught. She is altogether idle and careless, feeding upon the labours of others, and where ever she comes hath a full table. For her the Goats are milked, and the Bee bestowes her pains as much for her as for any other; the Cooks provide Meftles for her, the Confectioners Sweet-meats, the Apothecary Syrups, and these the tables before Kings, and walking all over the table she feales her self with them in their company, as also with all other whatsoever. Plantus took her to be of no use in his Caleuloi where he thus speaks: In my conceit you are a kindie of Lions amongst men, as Flies Gnats, Sowlies, Fleas that do much hurt and do no good.

Well therefore did Nature take care, that she should have no certain place to dwell in, as honest folks have, but should wander up and down, where she could get her a lodging and traveling harbour. But in imputation she goes beyond any beggar whatsoever; because they having had once the dam has therewith satisfied, but this beggar will take no answer, but will fill his unprofitable gut with the best cheer in the house whether the matter will or no. Ariflanus in his Lythgoeic recited by Athenes, brings in an impudent Parado Paseking on this manner:

**Canis etiam non vocatus, ut muscas advocat.**

I hallow to supper as the Fly, without any invitation.

Some such like matter Socrates upbraids Theodorus withall in Xenophon: wherefore the Egyptians being to set forth dishonestly and impudence together, they made the picture of a Fly. 36 Ornis faith. Whence it is, that Cicero (if I be not deceived) faith it was faid sometimes by way of jest concerning a troublesome indigent youth, Abige Muscapeper. Boy beat the Flies away. To this fo princely a little beast Nature (as meet it should be) hath denied long life therefore, 'For as soon as winter begins to come on, the greatest part of them expire; and those that escape flaying in cliffs, walls, hollow places, ovens and ock like, they lie all the while weak and languid, and not able to hold out another winter.' All of them are begotten of filth and innomine, to which they most willingly cleave, and resort especially to such places which are to unclean and filthy; unquiet are they, importunate, hateful, troublesome, tumultuous, bold, savoy, Homer amongst the battles of the gods and heroes elegantly defcants upon the bafhefe of the Fly, who like the Moule, alwayes hath his hand upon another mans trencher.

**The Fly, though often forced from your skin; Yet she returns again; she'll never sin.**

Yea Solomon himself thought their nature to be so bad, that he faith in his Proverbs, that one of them is able to spoil a whole box of ointment. To conclude, the Hebrewes to set out the Prince of Devils, called him Balabolus, i.e. a Fly; which with the same diligence, and never leaves off doing of hurt. Which is the reason that Witches and Wizards will have their Familiar to be Insects in likenesse of a Fly, using the body of a bad creature to far worse purpofes. I could alledge much more a great deal than this against the Fly, if I defined the name of Antilucan, with whom it is a dispragament for a Chilian to contend, yet or to meddle withall, more than with the most loathsome carkale. Neither will it be more disguise to me to make nothing of a Fly, than for Lucian to make him an Elephant: both indeed being too lofty of time, and vain ostentation of wit. But yet nevertheless that left like the Eagle I may seem to concern flies, or to neglect the least of Gods works; I shall with all diligence set down the Generation, Difference, and Life of Flies.

Flies are generated two waies, by coupling with their own species (which is done in the summer season, and in the winter if the weather be fair) or by the putrefaction of other things. The Flies are copulation, some of them dispatch the work sooner, others after some space of time: the manner whereof (as Arifli, affirms) is divers from most of the other Insects; for when the male attends the female, he takes the name of the female (that is stretched forth to seek for seed) into his body, the which being accordingly received, he furnisht with matter and strength to bring forth. Reuend Pennius saw two Flies at Hedelberg flying in the act of copulation, who (as it had been the son of Mercury or Venus) seemed to be of a mixed nature, and they did get up by turns. Somewhat a while after copulation they exclude or shoot forth little worms, as the Hen doth eggs; which afterwards by a strange Metamorphosis are again changed into Flies. Although Pliny contrary to experience doth without ground affirm that nothing else doth arise out them. Very rightly Scaliger faith, that the Flies at first do generate Insects unlike themselves, but ye in a capacity of becoming the same, (that is to say) white little worms, which afterwards being
being made like to Flies, have eyes hanging down by their sides; in reference to whose likenesse there is a kind of digitation in the eye, called *muscina.* i.e., headed like a Fly. Now, a great number of Flies, if not the more part of them, arise from dung, whence I have seen them to come perfect where before they were begun. But in this kind of generation we must note, that Flies are not immediately procured of dung, but of the little worms proceeding of digested dung, as the Philosopher writes in these words, "As a *musa* in the *musa* digests in parts gigantur, &c. Which Gazzara translated thus: *Mycis ex vermiculis simi digests in partes gigantur,* &c. In English thus: Flies are begotten of dung digested into parts, therefore they that desire to meddle in this business strive to diminish the dung that is not digested from that is mingled with that which is digested. Now these worms at the first are exceeding small, afterwards begin to be red, then as yet without motion as it were, cleaving by fibres they begin to move; then they become unmoveable worms, afterwards they move again and become again to be without motion, and in conclusion by the assistance of air and sun there is begotten a living Fly. Arise, here, as it seems; I speak rather from other observation than his own skill. For neither those worms that are generated by copulation; nor those which are bred of purefulation are so many metamorphoses or transmutations, before they are transformed into Flies. For they only grow to such a magnitude, afterwards are turned into a Nymph or young Fly, and so lie still, then at a certain time appoined by Nature the Nymph growth to be a Fly.

Neither are Flies begotten of dung only, but of any other filthy matter purefayed by heat, in the summer time, and after the same way spoken of before, as Gropalus and Lonicerus have very well noted.

But yet the question would be, whether Flies are not immediately generated of purifation, and not of those worms. For experience witnessed that there are a certain kind of Flies which are begotten in the back of the Elms, Turpentine-trees, Wormwood, and so perchance in other herbs and plants, without any preceding vermiculation, or being turned into little worms first. So that Scaliger that angelical man, and the most learned of this Age, writeth thus of their original: *Peradventure (faith he) they may seem not to arise from purifation, but from some certain principles changed into some sort of liquid gum, or from some other matter concocted by Nature for this end. Now whether concoction can be without purifation there is the scuffle. Each part of mans body hath its conveyance for the expurgation of its excrements, called in Latin *Emunitor vix.* But whether a living creature may be the excrement of a creature that never had life, let others determine; here my light falleth me, or rather I am altogether blind. A third way how Flies are begotten, Sir Tho. Kemsow an English man, and of singular learning, did find of all in form *Pensius,* and it was thus: The corrupted body of a Caterpillar or a little brownie, is converted into an imperfect Aurelia, from that not a Butterfly, but three black eggs are cast out that are somewhat long fashioned, from whence proceed ordinary Flies, or others like to them; and sometime the Aurelia being purefayed, neither Butter fly nor eggs come forth of it, but white worms, (sometimes one, sometimes many) come forth, whence are generated very small Flies.

The which famous observations of natural History truth it fell doth enjoy as to acknowledge received from the foresaid Knight; for no man before him did ever observe the like. Peter Martvry in his 3 Decad, and 6 Book, reports that the few drops of sweat falling from the fingers of labourers, turned into Flies, and so they wrote that in the marshy Country of Paris by reason of the contagious and venemous quality of the air, the drops that fell from the hands of the labourers do bring forth Toads. But whether it be done immediately or meditated by some worm out of which the Fly should break forth, he doth not think.

In the year 766, before the Nativity of Christ, Rivallius then being K. of Britains there were showres of blood three days together very great, very many, from whence came abundance of Flies, and so poysonous, that with their stings they killed a great number of people: so faith the English History.

Now the Fly for the most part is not at first a Fly, but a worm proceeding either from the dead corporpes of men, or the carcasses of other creatures, then it gets feet and wings, and so becomes of a creeping creature, a flying; and begets a little worm, which afterwards becomes a Fly. Take off the head of a Fly, yet the rest of his bodie will have life in it, yea it will run, leap, and seem as it were to breath. Yea when it is dead and drowned, with the warmth of the sun and a few flies cast upon it, it will live again, being as it were anew made, and a feth life put into it, so much that Lucian his disciples were persuaded and did verily believe that the soul of them was indeed immortal. Forasmuch as it goes and comes, it owns its own body and raiseth it up, so that it drinketh, eateth, wipes its head and eyes, makes clean its four ends, cleans, and its legs, claps its wings, and flies: verifying the opinion of Plato concerning the immortality of the soul, and the fable concerning Hermias; Ciaemoninus whose soul would often go out of his body, wander up and down a great way by it self, and afterwards would return into the bodie, replenish and raise it up again. Some will put drowned Flies into warm Athes, or warm Bran, and in a quarter of an hour foiling them in their hands and breathing on them, they will bring them to life again.
The Theater of Insects: or, Book I.

Chap. XI.

Of the divers kindes of Flies.

There is a great deal of difference amongst Flies, whether you respect the matter or form of them. Some of them come from themselves by way of copulation as hath been said; others from some avaricious or external matter: such are they that are bred in Dung, Apples, Oaks, Beans, 

etc. In regard of their form or shape, some have two wings, others four, with horns or without; some short, some long, some have round tails, others sharp or piked, hairy and without hairs: in a word, they vary in colour, shapes, bigness according to the nature of the Country they live in, or the partaken matter whereby they are made. I wish I had seen them all, and I know Apelles himself would hardly have been able to paint their fashions.

Now for brevities sake we will make two sorts of Flies. For either they are animalia, or insecta. Those that feed upon their own species, or those that feed upon other things. The first of these called in Latin, Luperus, in English the Wolf-fly, is described to be big, black, with long flanks; he feeds especially upon flies, if he cannot come by these he preys upon other Insects. Those that feed upon things of another species: either they are such as feed upon living creatures, or upon things innamor or without life. Of the first kind is the Flesh-fly, Horse-fly, Ox-eye-fly, the Suck-egg-eye-fly, the Fly that eats Serpents, the Dung-fly, the Fly that preys upon the Humble Bee.

The Flesh-fly.

In regard of his bigness and bulk of his body, he is the biggest of all other, he hath a reddish head, his body full of gray spots, his belly thick, bloated, transparent, having two wings, hairy, very greedy of flesh. He flies for the most part alone, unless it be perhaps in the flesh-market or Shambles; where the Butchers turn fencers, continually killing and beating them away with their Fly-flaps, left with their fly-blowses (which Hippocrates called vena in Greek) their flesh should be tainted. There is a story (as Celsus Rhodiginus relates it) that at Teaenum in the open Butcher-row, one Fly amongst the rest used to come by the space of an year, as white as snow, which I dare say was of this sort in regard it was seen to be so long together in that place. Apis solia, Myia canna, in English a Dog-fly; in the German tongue Hund Fliege, Hund Mucken; in the Pololian, Pha Mucka; in French and Englishman, and Philo, hippopite to be a Wood-fly: very irkome to the ears of Dogs, the which notwithstanding they make it off never; so oft, yet it returns with as much violence as before; where if he carry any white, with the galling of the flesh he raveth a bitter: of whom Homer in his Iliad. 15, Troy do mention this way, which I suppose, i.e. Why like a Dog-fly deft but contend with the gods? Atheneus also in his 4 Book, reports that the like name of Dog-fly was given to a certain famous Curtizan for her unparalleled impudence, mordacity and troublesomeness. Now the Dog-fly (to borrow the words of Philo) is an insect that bites hard, is importunate and treacherous: Veneris cum undique, arduis & insidias. This seemeth to me in holy Writ, as in Exod. 8, Psa. 77. & 104. to be the common name of all hurtful Insects, as appeareth by the Chaldee Paraphrase. As for their more special signification, they can be compared to no kinds of Fly better than those black great broad flat ordinary Flies which do so boldly fly upon carcases, and not only suck from the outermost skin of them privy blood as other Flies, but with great pain thrust out, and suck blood very deep. They want a snout, but in stead thereof they have two teeth as the Walps have, which they fasten deeply into the skin, but more especially they infet and annoy the ears of Hounds in Germany, in much that (as Camenarius witnesseth) they even pluck off the skin. These an English Gent, said he saw in Italy in flape altogether like the Dog-fly, only without wings: whole wings also are represented to close to his body that the learned Dr. Barbe takes them for the same. Chironia doth attribute unto it wonderful swiftnesse of flight and roundnesse of body. The nearest in likenesse to it is the Tick or Sheep-fly, making a kind of a horrid noise as he flies; and in his flight more fluid and heavy then a Gad-fly. These are two kinds of them, differing only in bigness, the greater which is the Forrest-fly, the other the lefe living in hedges and quicksetts.

The Horse-fly.

The Horse-fly called in Greek equidae, in the German Tongue Rost Mucken, is of the bignesse of the ordinary Fly, with a flat, hard, smooth body, and so compact a substance, that you can scarce break it betwixt your fingers; they are somewhat blacker than the common fort of Flies are; they never fly right forward but sidelong, as it were hopping and skipping as they go, they fly neither long or fast. In England especially they are very troublesome to Horses, flinging them continually about the ears, nostrils, stones, and
the tails, with the sweats whereof flowing down to the root of the hair they live and are fatained. The English call it a side-fly or a Horse-fly, as the Greeks θυγρός φλέκτης, of the like signification. Some of the Greeks call them διαμνηστής, and they say that in hot Countries the Dogs are very much vexed with them. They say that it is of that kind Creto makes mention, having wings and able to fly; but yet I think this to be another species; and only proper to Horses, and offensive to them.

This Bealt-fly is in Latine called Aflium; in Greek φλεκτή from φλεκτός Bees of king or flying: whence not only this insect but another that useth to bite the Horse (of which hereafter) and a third very formidable to some kinds of Fifth, are called by the same name of Oflim. Of this kind of Fly the Poet Virgil in the 3 of his Georgics chuseth him; his manner:

A Fly there's in Silanus woods; that much
Useth mere to green holms, the Greeks call such
Oilians, Aflus is the Latine name.
It makes a sharp harsh noise, and with the same
Heards of cattel frighted fly and quiver,
Woods, and banks sound of Tamagius River.

Calepine and other Lexicographers of his gang, before some Physicians, and even Pliny himself. Difference if makes this Fly one and the same with the Oxe-fly, so that it is very probable that they did not so heedfully read Aristotle as they might, or did not indeed understand his meaning. It is confessed on all hands that Aflis and Tabanis are a species of Flies, and that both of them have a sting in their mouth, with which they pierce the sides of the beasts, and suck out their blood. For so the Philosopher, εἰ φυγείοις καὶ εἰ σφιδαὶ της σπειραί της ἀληθής: Oxe-flies and Brees make holes in the skins of four footed Beasts, and they have a strong tongue which serve them for a sting, they are creatures that eat blood, &c. But yet that they differ much, Aristotle and Aflis plainly shew. First the Tabanis are more frequent especially in woods and highways that are better with trees and hedges, as they who use to travel on horseback know to their great trouble and vexation. For in the heat of the day they sting deeply: And being then greater in number do draw out such a quantity of blood, that many times the horses strength fails them, insufficiently that the Country people are forced to beat them off from their horses with fly-flaps and bought which they carry in their hands. But the Aflis are more rare, and never fly but near the water side. Moreover the Aflis (as witnesseth Aristotle) do take their beginning of certain kinds of broad and flat little creatures which haunt about rivers sides: but the Tabanis come of certain worms breeding in wood or timber; that which Socrates wrote, and Piersius diligently had observed. Besides the Aflis do trouble Oxen and all living creatures, according to that of Hesychius, χορεύεται πνεύματα τοις ημεραίς τοις μηταί κατα μισθόν, εἰσίν ἐνοχά τοις, but the Tabanis trouble Oxen only. To which agree that of Orphes: ver. 47.

Not δι' ἐμί διεσκευάσθη διότε δολος δολος, Ποιεῖται δόλως βασιλεύς εἰς βασιλέως ἄργον, ἐτεράσεως ἀργόν, ἁγνὸς τὸν ἀργόν ἄργον καὶ δολον, ἐτεράσεως ἀργόν, ἁγνὸς τὸν ἀργόν ἄργον καὶ δολον.

The horrid Brees mens body doth not spare, He flies from us into the open air.

And Homer in his Odyssey:

Οἶχος ἐκ τοιχῶν κα' ἐφ' ὅπως, κα' ἐφ' ὅπως Τὸς μαθητήν ἀδίστακτος ὁμοιός
Πηγῆ ἐν εὔμενοι, ὥστε τὰς ψυχὰς ὑπάρχον τῶν.

But they fled home as herds of Oxen doe,
When that the Brees doth force them for to go,
In the spring time when dates do longer grow.

Where the Scholiast thus defines this kinde of Fly, Οἰαρίς οἰαρίς διηαρίζοντος παρακάτω, &c. The Fly called Oftrim is of a yellowish colour, who when it enters the ears of the Oxe, caueth him to run mad: upon which Callimachus in imitation of the Country people calls him βατόκατος, an Ox-driver. But the Mypes or Tabanis do sit upon Men, Hores, yea and Serpents (as Nicander affirms). Their shape and form is also different, as the Philosopher Thweth De part. Anim. l. 2. in these words: The tongues of the Aflis and Tabanis are alike of a purple colour; yet these dare not go any nearer them, the other upon Oxen only. Now the Aflis hath a green head, and the rest of his body all over yellowish, having a greater inste to than the Tabanis; but making not to bear a noise, or buzzing he carries before him a very hard, flinte, and well compacted sting, with which he strikes through the Oxe his hide: he is in fashion like a great Fly, and forces the beasts for fear of him only to stand up to the belly in water, or else to break themselves to wood sides, cool fades, and places that the wind blows through. For whilst they stand in the cold water they flap their wet tails all about their bodies, and so cause him to be gone.
The Theater of Insects: or, Book I.

The Bee-fly.
The second kind of Tabanus.

Gnat like.

Tabanus.

gone. The Scholiast of Nicander faith that they are bred of Horse-leeches. As if he would have us to understand Horse-leeches by those flat creatures (of which Asfis makes mention before) and yet it is against nature or experience that blood-fucking mothers, should bring forth a blood-fucking brood. He flies exceeding swiftly; draws blood with much pain.

Pennius harfhett down a very rare kindes of Asfis, one of which was sent him out of Virginia by white, the other out of Kijtia by Elmer a chirurgeon for a great present. That out of Virginia was full as big as the biggest Flies, having a reddish head, and very like in shape too, but only that the head was black, and had from the shouloders a white streak drawn to the mouth, having also bigger and blacker eyes. He had in his mouth a long sting; and very strong, his shoul-der of a blackish brown colour, from whence came forth two wings of a silver colour, to the tail downward, it had six or seven joynts or figures, of a whitish colour, all the rest of the body blackish. In swiftnesse of flight inferior to none; pursuing the meat; his belly was between an ash and yellow colour, or a pale green. That of Elmer which came from Moscoy, had silver wings longer than the whole body; great eyes, very long, taking up almost all the head, a black bill or beak, hardly tripartite, with which out of hand the penetrates hole lined with a three double cloth, skyn flesh and all, sucking it with great pain. As for the Generation of the Asfis, or the Fly with great eyes; I wonder at the inconstancy of the Philosophers opinion thereupon. For first he makes them to come of a little flat creature swimming in the water (which the Scholiast of Nicander not unfairly calls Flutias, i.e. Hirundines in English Horse-leeches) and in the 8. of his Hiflo-y, he will have them the off-spring of the Gnat, in these words: ινα δι τους οαμ ου το νους μαρκαί ζησι κατα το ου μάκαρ, φως ου το μεν μαρκαί ζησι κατα το ου μάκαρ, ή γαρ ου μεν μαρκαί ζησι κατα το ου μάκαρ. Some living creatures live first in moyleauses, and after that they change their shape and live out of it, as it falls out with Gnats about rivers, from which proceeds the Bees. But how that can I know not: For of creatures that hive wings, it is impossible that other winged creatures of a diverse form should be generated, as the diligent observer of Nature may easily gather. And so much of the Oxe-fly which the Gnat call Hefnotyvis: but the English have no name for it. [Wherein the Author seems to me to be mistaken, because it hath afforded it a very proper name as is above mentioned.]

The other Tabanus or Asfis is begotten in the utmost part of the combs, and exceeds in big- nellie any Bee whatsoever; which, because he is so troublesome, not suffering the Bees to be at quiet (as the former would not suffer the cattle) the Greeks have comprehended under the same name of Oegyptus. The head of this Fly is of a bright bay colour, with a white streak running from his forehead to the nape of his neck, his shoulders and back of a darkish colour, in all parts else no way differing from the common fort of Flies.

He feeds not only on the juice of flowers and honey, but on the blood of beasts, which with great seditioneness and pain he sucks out.

Thee is another Fly much of the same sort, with a head and body more inclining to green. His shoulders shine with greenneffe, wings he hath two, whitish in the middle and outward parts, but are otherwise blackish or dunnish. This only once Pennius saw it, it Hanworth in the year 86, in the moneth of August. In the year 82, he found in England two other sorts of Flies like Gnats; one of which had a pretty big body, of yellow and red colour; it had two wings, the head very long, the tail reddish. The other also had a long head, very slender and shanks of a very sad black colour; the latter were longer than the former which he fretched at length when he flew and let hang down.

A Country-man there was that affirmed for certain, that out of their eggs (for he had observed them coupling together) came such worms that usually eat the leaves of trees.

The Fly called in Latinus Tabanus is of the Greeks called μουθος by reason per chance of its flinging or picking, for μουθος signifies also a spur wherein horses are pricked or spurred. The French call it Tabou; the Italians, Taban; the Spaniards, Tavans; the Germans, Bven, Kunfliege, rot muck; the Brabanters, Raukefliegen; the Polonian, Kpreza muck; the English, a Burrefly Stom, and Breese; and also of tickling and cling, Cleg and Clinger. This Calpa is more boldly then truly faith hath four wings. But with more judgement Alban and others, say it hath but two silver white. The whole bulk or body is very long, divided into three principal parts, the head, shoulders, and the ventricle or belly, distinguished with five or fix clets or incisions, the whole body of a blackish white, in the mouth of it it carries a strong long, and brownly proboscis; it hath six black feet in all parts else representing much the Dog-fly. In the months of July and August by reason of the extemity of heat they are most fierce, and do feriously handle Oxen and Horse, and young cattle, unlesse protected with fly-flaps, bushes of trees, or plants: which they follow by sent of their sweat, because they cannot reach them with their fight, being very weak spirited, from whence the infirmity of the eyes called purblindness is in Greek termed μουθος. They are generated faith by nature of the worms that come out of the wood pulfed. Which some cunning men before they have wings did use to bind about the wriif of the left arm as a remedy against Quartin Agues. They suck out blood with fixed force and in so great abundance, that a friend of mine whom I dare believe told me, that his horse being tyed...
tyred to a tree, was by reason of the multitude of them, killed in leafe then fix hours, they had drawn out to much blood that the spirits failing he fell down dead. By these things it is manifest, that the Tabani are of a different nature from the Aphlis; notwithstanding that most of the Greek and Latine Authors do seem to confound them and make them all one. Yeas even Gelseus himself in this very matter could not tell what to say in his book de Quadrup., and indeed unless it were only Piscinus and my friend Pennius now deceased, no man as yet found the difference between them. Aradius is here defined to be confined in the first place, because he finds that both the Tabani and Aphis have sting in their tails as the Waps have: and secondly, because he makes them to have eight feet, whereas none of them in the world was ever known to have above fix. Lastly, he reckons them in the clafs or rank of Gnats, whereas the Gnat never bites in the heat of the day (as the Aphlai and Tabani do) but altogether in the night at what time they are very irkome indeed,

Next to these is another Fly shrewdly annoying Cærell in the heat of the day, which Pennius calls Curvicauda, very well in English a Wrinkle-tails, in regard that alvities sitting upon the buttocks or belly of the beast, he bends his tail towards him with his sting stirtet, that he may be ready to strike at pleasure, whensoever opportunity may offer it felt. This Fly the English in their proper tongue call a Whame and a Burrell-fly, and it is scarce found any where else but in England. This kinde of Fly is almoat like the Bee in shape and colour, only it is bigger in body. It doth not cleave to the ilein nor fack blood as others do, but only thins with its tail, flying a long way after horses, and flinging them in their travel. Horses are naturally afraid of this Fly; whom upon the least touch they endeavour by what means possible with their tails, feet and mouths to drive away. Some are of a minade thane flies do not indeed give a sting, or prick, but with their tails they fatten their dung to the horses hair, from whence a white afte: come a number of very irkome Nits. But experience must prove that for reason in a matter so improbable is silent, True it is they are very violent upon their prey, as being blinde both the Tabani and the Wrinkle-tails, which may be the reason why they are so bold and fearles, as being feeke of any dinge. But especially the Ostrum from whence those famious Poets of old were fited to be Ostron perchis flung with this furious Fly called Ostrum. Plintarch calls them

The kinde of Flies that follow are more rare.

The first of which is very like the leffer Butterfly, with four filuer wings full of blackish spots, all the body over adorned with fiver streaks running athwart of it, the tail redish or brownish, the head black, the shoulders of the same colour with the tail, the fore-yards are thin, black and short; the feet small and black; they are most commonly teen in hedges, especially in the morning. The second very little differing from the former, but that the body, tail-yards legs and feet are of a brownish or dusky colour. The third species hath four wings: this hath longer wings, than the other, spotted with black spots, the head somewhat bigger, black, here and there marked with yellow spots; the two tail-yards thin and black, six whitish feet furnished to the more bulky breath, the shoulders are embowered with yellowish white spots, overthwart the back are five streaks of a yellow colour, with a little spot or speck between each almost of the same colour in the tail there are five red knobs, the end of which is forked. The fourth is not much unlike, but it hath silver wings, without spots, the tail-yards black and somewhat longer, the body is adorned with seven white lines athwart, I have seen also two Flies with tails like Scorpions, The first of them, as the former spoken of, hath silver wings, but somewhat lelle, with three crofe black lines towards the end, the head black, the breath, the feet and shoulders whitish; the rest of the body black, the tail hath five joints as it were or partitions, three of which are of a pale red, the reft black; the end of the tail forked, the forks are black, and like the Scorpion turned up, The other almost like to it, but the very end of the tail is more thick, the fork that is in it more blunt, the head dumbish, the mouth somewhat long; each wing bedeckt with fix black spots. There is also another sort of Fly that hath four wings, the body greenish, the four wings longer than the body, made as it were of melted fire, the nerves whereof are greenish, the tail-yards thin and black, eyes as yellow as gold, from whence it hath the name, and that undescribed of Christoph a golden eye, for a fly in flight, of a very

LIII

strong
strong fent, which like the Moth it leoth with the life. A great frequenter of gardens and sitting on Elder; whether he come of a Caterpillar, as the Butterfly doth, or out of the worms of trees, I cannot tell. That most learned and courteous Gentleman Joach. Camerarius first shewed it to Pennius.

There are sundry sorts of Flies, of the Greeks called πυτερίς, in Latin, Pilicauda, Seticands; in English Hair-tails, or Bristle-tails. For some of them have one, others two: other some yet three or four bristles in their tail: of which in order,

The first of these called Hebdrias, or Vultus, is a fly that hath a tail, the whole body is black except the middle or the back and belly that are red; it hath two silver wings, the shoulders thick, with two little black tail-yards, and a long bristle shot forth of the tail of it. The figure of this fly did the above said Joachim tend to Pennius, with all attending that it never offered to light upon any other herb but the chiefest Amos. Biflises, are two Flies that have two hairs in the tails of them; whereof some have bodies sharp or pike at the end, others more blunt. Of the former sort, two I have seen with four silver wings without spots, head and shoulders blackish; the rest of the body dunmis, be decked with divers crose lines of black. Both these had long and slender tail-yards, and the like in the tail, only somewhat longer, the body big and bulky. Those of two hairs or bristles are of five sorts: the first in all things like those with a hair, but that these are almost all over yellowish that hath two very long bristles in the tail, one of which being fortune out at length is like the tail of a Greyhound running after a Hare; the other twiled inward is like a spiral line. The second sort, is a kind of long Fly, having four silver wings, yellowish feet, the body black, shoulders thick, two tail-yards long and slender, the belly toward the tail, bigger then the rest, out of which two short bristles do issue, turning upwards; it lives in hedges. The third of these Carolus Clausus sent from Vienna, with a darkish dark coloured body, the wings large in a mixture of blew and silver colour, the tail stamnated or pike, out of which grow two bristles or plumes rather (as Pennius observes) of a Partridge colour speckled, with black and dunmis spots intermingled. The fourth kind is of a round orbicular body, about an inch in length; the head, shoulders and breast very black, the horns short, it hath six black feet fastened to the thick breast, the foremost shorter than the rest, the hindermost the longest; when the flies the puts her feet together and lets them hang down, it hath four darkish wings of a silver colour, her eyes black and shining, the umbo of her tail black-out of which peep two very short bristles from the shoulders downwards to the middle of the tail; she is almost of a yellowish colour; the tail is joyed to the shoulder as it were with a long thread: it runs very nimbly and as it were leaping; her nest is under ground, the feeds upon small Flies and Caterpillars. The fifth and last sort of these, is by much the least, yet of the same form and figure, only it hath very bright silver wings; the whole body to the tail is of a tawny or darkish red colour.

Of those that have three hairs or bristles there have but 5 sorts come to my notice. The first hath a body very long and black; the middle very red from black, with two black horns in the head; silver coloured wings, the very edge or extremity whereof is spotted with a blackish spot, the thighs or shanks reddish, in the tail it hath three long hairs or bristles, and flies very swiftly. The next is like to this, but less, all over black, longer than the former, thinner and flender, it hath silver wings also, the cornicles or horns all one with the former, it also threfith forth, three long bristles at the tail, not so swift in flight by much as the former. There is another of this kinde all over whitish, but only the wings, which are spotted with four black spots; the umbo of which are larger, the others shorter, which
Of lesser living Creatures.

The Fly with four hairs represents the fifth of those with three hairs, only its tail is somewhat bigger at the latter end of it, the feet as also the horns black, the wings long, the innermost three times exceeding the outermost in bigness, having a black spot in the middle, and in the tail four hairs or bristles.

To these are to be reckoned those Flies called in Latin, Meller, Pavones, and Libellae; which the Greeks from the likeness of a fifth of that name called Eus-alrus. In English they are called Adders, Bowls, Dragon-flies, and Water-butterflies; because they are seldom seen on land, but always about waters, as rivers or fens. The Italians call them Cervisont; the Hollanders, Romdons: for the form or shape of their bodies they differ little or not at all, but only in colour: some of them have bodies two inches long, long, and slender, withal, in form of a pipe or corner: and these consist of three parts; the head, breast, and the rest of the body, which is in feet of a tail. The head with two great goggle eyes, of the same colour with the rest of the body, is made fast to a very short neck to which the fore-feet are joined; all the rest being annexed to the breast. The hinder feet likewise are the longest, the better to lift up and fly their bodies. All of them

Lill 2 have
have forked tails, and with these they couple; remaining long in the act of generation. Cour-
treymen for the most part of them, are of oppo-
tion that these Flies are ingendred out of the
worms that grow from the water-bulrush put-
trefed; which if I should yield to be true, yet
doth it not take away copulation, and putting
forth of worms from their own bodies, whereby
they might from time to time increase, and
perpetuate their propagation.

The lesser of them are very slow of flight,
the greater very swift, and are only to be
seen in heat of Summer. Of these we have obser-
ved three sorts or species: The greater, lesser,
and leaft of all. The biggest of all, some of

the English call Brifes. Of which sort eight only
have come to our view. The first greenish, the
spots also in the neck and tops of the sides of a dark green; the wings silver coloured, they are
swift and make great speed in their motion. He hath seven black lines athwart the back, and
feeds upon flies like the Swallow. The second is like to this, but of a more dark hue. The
third hath eyes like to pearls, silver wings, the hem or extremity whereof is stained with a dusky
spot, the body is black, but very feldome yellowish on the back and belly; the tail black and
forked, adorned as it were with two plumes. The fourth is of a muddy colour, having the sides
divided as it were into six parts; near about the coming forth of the wing which are like silver,
you may perceive a large black spot, distinguished in the middle with lines of mud colour, toward
the end of the tail there appear four or five hairs or bristles. The fifth hath its head and tail gray,
the mouth black, the silver wings marked with one spot, in the end of the tail it hath three bristles
in manner of a Trident. The sixth is silver winged, with a black spot in the middle, the body
all over black; the back and belly sometimes, but that feldome of muddy colour, the breast and

The greatest Libelle.
The Mean.

The Smallest.

shoulers half black, half yellow, under the end of the tail two hooked bristles, at the end of all five but very small.

The seventh hath a head, neck, and shoulders of a dusky colour, the rest of the body red, procreated in Pennius study of a little worm that we never had seen before. The eighth shorter then the rest, with eyes like pearls, the body all over of a yellow colour, except where it is thwarted with cross streaks or lines, the tail seems as if the end were cut off, the but end thereof more broad, the extremities of its silver wings are darkned with a black spot, they are to be found most commonly amongst the corn.

The middle sort of the Libella do
Chap. II.
Of lesser living Creatures.

for forth Nature's elegance beyond the expression of Art. The first is of a multiform colour. The blue body or sky colour, the wings of bright violet colour, the space between the shoulders is adorned with four golden gems, set as it were in a blackish collar. The second has the head and body gray, the wings white, which are beautified with gray lines drawn quite through them, in the middle they are of a purple colour. The third has its head and body of a greenish colour, the lines of the wings are marked as it were with blood colour streaks, towards the edges or outermost parts like to a dark purple. The fourth seems to be all over of the same colour, to wit, of a dullish colour mixt with a pale green. The eyes of the fifth are blue, the head green, the whole body mixt of green and blue except the wings, which are most accurately wrought with silver colour and black, in the middle shadowed with a dark purple. The sixth is all over green; yet the wings themselves are of light green.

I have seen four of the last sort of the Libella. The first the body all over of a bright blue colour, the second red, the wings alike to both of them a silver colour, The third yellowish, but the tail more thick; the edges of the wings (as also all the lines that run along them are red and marked with a blood colour spot. The fourth which is the least of all, hath a long spiny tail, a great head, blue eyes standing out with two little horns to guard them; the body somewhat long, thinner, underneath greenish, above blackish, on the back it hath two greenish lines or streaks drawn along from the head to the railing of the wings, the tail bound together with five joints or knots, in the end whereof is a ring of bluish colour.

There is one of this number which killeth some of the other bigger very speedily: of a thin gray coloured body, and the wings alike coloured, and when he creeps into an apple, no hole can be seen where he went in; he feeds also upon feeds. This Fly William Brewer a learned man and an excellent naturalist sent to Penninis. They are found in the leaves of young Fenel. Flies of an exceeding fineness, in summer sometimes they are so little, that they are not able to be seen; they run and fly very swiftly, as much that you would wonder how it were possible for nature to furnish feet and wings to such very exceeding small bodies.

Water Flies, of the Greeks called blue, or Lantafires, as abiding in funny places, are those that feed upon things that swim upon the surface of the water, and that live especially upon the water, as these and the like, Phryganides, Macedonias, Tigaran, Ephesides Lutes, Poenis &c. Phryganides comes from the little worm Phryganiwm (which in English is called Cades worm) living in the waters, and in the midst of August, ascending to the top of figurines of the waters; it hath four wings of a brown colour, the body somewhat long, having two short horns, the tail forked, or rather bristles coming out of the tail. The form or figure of this Fly is various in regard to the great variety of those little Cades worms whereof they come.

Among the Macedonias about the River Augurum which runs in the midst between Borea and Thesalonicis there fly a kind of Flies, which are not every where to be found, neither are they any way like other Flies, they are neither like the Bees, Wasps or Hornets, yet resemble all in something, in bignesse the Hornet, in colour the Wasp, in hummings the Bee; in audacity and boldness all the rest of the Flies; the country people call them Joyntis, the Latines Eg立tes; these being flown upon the surface of the waters become a prey to the fish that are in the river. The greater summer Water Fly is seen in Helvetia in the month of May (commonly cold Tes giffas) as we have heard reported by a Gentleman, but which we leave to those of that Country to describe. The Ephesides called, are a kind of Water-fly of an ash colour, with four wings, six feet, near the tail having as it were many downy hairs. The Ware-fly called Luta is of a yellowish dun colour, it hath long wings, always standing bolt upright upon the shoulders so long as it flies, the eyes big and standing out of the head, the tail long and knotty, having two long hairs or bristles at the end of it; the is convergent alwayes about rivers, seldom elsewhere, especially at rain. There is another of a dun colour with four long wings, and long shanks, the body full of joyntes, two long horns it carries in the forehead, the head little, the eyes blackish and standing out of the head, the wings dun, but a little more bright then the rest of the body. For the most part found in woods adjoyning to fens and standing wares. To conclude, I shall relate amongst the rare sort of Flies, that of Cardanosthe himself describes it. Thus I have faith he little creature like a Beetle; of no unfavourable smell, small, and the width of all that eye I knew of Infides, it is of a dark yellow, not black, with six feet, and very short thin wings not covering the tail; the tail is of the same figure and form with the head, infomuch that you would think it had two heads; for as it hath a mouth in the upper part of the head, and two small cornicles there under the chin, so it hath two others also in the lower part longer then the creature itself, as many likewise in the tail, but these longer then the two lastest in the head; only the uppermost of those are longer and thicker then the lowermost, Whish rare creature I wish I had seen with Cardanus, that I might have here added to this description the figure of it. There is also besides these a Ware-fly, which men call from the length of the feet or shanks of it, Tigaranum, Macedonias, Podanum, Grunias; called therefore in English a Gnat Fly. Of these Flies are found four sorts. The first species hath long shanks like a wood Spiders, the body almost oval of a whithish ash colour, silver wings, black eyes sticking out, with two very short horns, the tail pointed or piked. It flies (much like the Odrich) hopping with the feet, sometimes it flies in the air but not far nor long. So greedy after the lights, that it often.
oftentimes is burnt in the candle. In Autumn it is frequently seen in pastures and meadowes. This of the male kind. The female is almost alike, but somewhat more black, the end of the tail as it were bitten off; these are called in English Shepherds, in Latine Opiliones, because they are most often seen where sheep use to feed. The second fort of *Tipula* hath a great head, eyes standing out, four small horns; the body pleasantly various with the colours yellow and black interchangeably mixt. The third is almoft like unto this, having that the body being all yellow, is better seen out with fix or seven black spots; both the male and female have a three forked tail. The fourth species is very rare and curious, the head and especially the mouth forked, the shoulders swelling, the feet shorter, the body twice as thick as the rest; the back black, the belly and sides yellow, the tail black and picked. It lives in hedges in the Summer, and is seldom found in open fields. Those *Tipula* or Crane-flies aforesaid do couple with their tails turned to gether, and so they fly; yet sometimes they turn again as it were to embrace one another.

**Chap. XII.**

*Of the use of Flyes.*

These little creatures so hateful to all men, are not yet to be contemned as being created of Almighty God for diverse and sundry ues. First of all, by these we are forewarned of the near approaches of foul weather and storms; secondly, they yeeld medicines for us when we are sick, and are food for divers other creatures, as well Birds as Fishes. They blew and see forth the Omnipotency of God, and execute his justice; they improve the diligence, and providential wiltome of men, All which shall appear in their places.

As for their prefaging of weather: when the Flies bite harder then ordinary, making at the face and eyes of men, they foretell rain or wet weather: from whence *Petitian* hath it.

---

*Sittariis; cruris*

*Musca redit; summus; proboscide mordicat arm.

English:

Thirstily for blood the Fly returns,
And with his sting the skin he burns.

Perhaps before rain they are most hungry, and therefore to aswage their hunger, do more diligently seek after their food. This alfo is to be observed, that a little before a shoure or a storm comes, the Flies descend from the upper region of the air, to the lowest, and do fly as it were on the very surface of the earth. Moreover if you fee them very butie about sweet meares, or unguents, you may know that it will prefently be a shoure. But if they be in all places many and numerous, and shall to continue long (if *Alexander Benedic*it, and *Johannes Damascenus* say true) they foretell a plague or pestilence; because so many of them could not be bred of a little putrefaction of the air.

**Many**
Many wales doth nature also by Flies play with the fancies of men in dreams, if we may credit Aegoparius in his Apuleius. For the Indians, Persians, and Egyptians do teach, that if Flies appear to us in our sleep, it doth signify an Herald at Arms, or an approaching disease. If a General of an Army or a chief Commander dream that at such or such a place he should see a great company of Flies; in that very place, where ever it shall be, there he shall be in anguish and grief for his Souldiers that are slain, his Army routed, and the victory lost. If a mean or ordinary man dream the like, he shall fall into a violent Fever, likely may cost him his life. If a man dream in his sleep that Flies went into his mouth or nostrils, he is to expect with great sorrow and grief imminent destruction from his enemies.

Nor do they only foretell dreams, that shall fall on such diaries, or such times of the year; but they do afford much matter for Medicine, and cure for diseases. For Galen out of Sarranius, Aegoparius Cleopatra, and others, hath taken many medicines against the diseases called A abolish or the Foxes evil, and he united them either by themselves or mingled with other things. For so it is written in Cleopatra's Book de Orinatu. Take five grains of the heads of Flies; beat and rub them on the head affected with this disease; and it will certainly cure. Aegofigens used to take a great many Flies heads fresh plucked from the body; and rub the part that was bare or bald with this disease, especially if they were exterminated. For the blood of Flies (faith he) doth much help the parts that are exterminated with Nitrous medicines, or are otherwise galled or fretted. Sarranius used to mix a part of whole Flies dried to powder, with Alconumini quick Brimstone, Gunpowder, lowes Gall, and other like things against the Fox-evil. Some add to these Beads joining roots of Reed, and Fern, and bark of Ochmea; and with which medicine they cure perfectly not only the Fox-evil, but whatever defution of hair, and the thimble thereof however contracted; the place affected being only first rubbed till it be red again, with fig-leaves. Others use the blood that runs out of the heads of Flies; others some apply the ashes of them ten days together with the ashes of paper or wood, so that the third part be the ashes of Flies. Some others do temper ashes of Flies with womens milk, or coloers; some only with honey. Play, after the same manner. Gaely and Marcella burn the heads of Flies and mingle them with honey in field of an oystent, and thus make a medicine against the Foxes Evil. The like Medicine Play, much to procure the hair on the eye-lids: Take of ashes of Flies and Mouth-dung of each alike mingled half a penny weight, and add to it six six parts of Silphium, and with these and Ophio for sheepes far against the part. Some prescribe Flies with the roots of Docks for the Leprone to be anointed withal. Play faith that these were some, that for the same cause did give a red Flies dead, in drink, but those that were very weak a fewer number. That Flies are very good for duney diseases of the eyes; not only Galen, Galen, Play, and Archippus have affirmed also Neutwerk, or later writers, especially for the Pin and web. Blue-eye, lime-eye, and warrs on the eye-lids. If the eyes be weathed in the evening with water of ordinary Flies distilled in way of bath for a monthes space; it will cure them of all spots or films. If the hair be often wet with it, it will grow exceedingly, But the Veil must be bathed in Winter, and the Material distilled about Winter. With two drops of this water put into the eyes; Galler writes, the deafness of them will be cured; and this Medicine he thought of a Jew. Mut ius, which was thrice Confult, from observation, did hang a live Fly in a little linen bag about his neck, wherewith the name of bloodshot of them was cured, as Play affirmeth.

Flies in an odd number being rubbed together are reported to be very good to cure a fallen on the ring finger. Bean Flies drink with vinegar do drive forth a hoarse breath sticking in the throat, Holy Abba. The Fly Napheus of the helb Napelleus or Wolfsbane to called, doth not only cure the poysien of that herb, but all other poysien whatsoever, as Avenit withnesth, and Juliani Scipig coloures from whence this Antidote is made. Take round Birth-wort, Wuthdiffare of each two ounces; terra sigillata half an ounce, Flies of Napelleus in number 18, juice of Citron what sufficient, mingle them, make an Opiaire. For (faith Scipig) against the biting of the Taras, or any other venomous beast, or the poison of Wolfsbane there is no Antidote comparable to this. The same do Flanermund, and Petrus Apponem teach us. Yes, moreover when as there is no Fly at all but will cause vomiting (as I shall make good out of Arnaldus) why may not all of them be thought preparatives against poysien? Cardainus in like manner commends the wormed Fly, But it is kept burning of medicines by hand and eye: For because it is a very useful, Iz. by known experienced, tell while we affeed unknown medicines we lose the use of those we know. He relis if that an oil made of wood Flies was in great estimation; yet he adjoins us how to make of to use it. A Fly chewed and swallowed doth vehemently provoke vomiting. Arnaldus, I have heard of a certain man (faith Gaffor) that was wont to take three of four Flies into his body, which gave him a very good food. Take five grains of Bonn-flowers, let them be put into an earthen pot, with butter here and there laid between them bed upon bed, with which the veil may be filled, and being very well closed, let it be buried in bore dung, where the Sun uether to come, for the space of one year; at the years end you shall find the Flies turned into an Unquene, the which afterwards are exceeding good for any grief whatsoever in any part of the body; as I have learned of a friend of very good credit. Nomeus advise to take the bodies of great Flies when the heads are off, and rub between the fingers, and so anoint a small impolite swelling therewith, for a special remedy. Forinus the Poet affirms, that
that there was a German maid which lived three years with eating of Flies. If carrick cannot urine, or the urine seald their genitals, put but a live Fly into them, and it will give them eafe. Columella.

Neither do they serve for the health of men and carrick; but withall do seem to be created for food and fullenance of many sorts of creatures. For there are some kindes of Spiders which hunt after Flies and prey upon them. Swallows feed on Flies and almost on them alone, as if they were to be suppos'd to be made only for them, insinu'd as without them the Swallow could not live: and that the reason why they hunt after them aloft in the air, in rainy below near to the earth. Pliny affirms that the Bird called Himantopus makes them his chiefest food. There is a kind of Duck called of the Tigurnius Muggent (as if you would lay, the Duck that catcheth Flies) like to the tame Duck in bignesse, which greedily snatcheth up the Flies swimming on the water and eats them.

The Chameleon which some have reported, but falsely, to feed only on the air, feeds on Flies, which with his tongue fix inches long, putting it forth suddenly and waving it to and fro, he bites unawares, draws to him and devours them, as I have seen with mine own eyes in the year 1571. All those Birds called Wagtails (if I am not deceived) live upon Flies, but especially those that are whirly about the tails: in the German Tongue tiaden wägen, but others call it more properly Muggen ficher; in Greek, τουπαριον; in Latine, Muscivorum; in English, the Fly-eater, as being fed with nothing else, as Bellonius writeth. The bigger sort of Zizanius, so called, feed on Flies which they catch as they fly, as Swallows do, and never mule one, as I have taken a great deal of sport to behold. The worms of Pheas-flies, which we English call Muggots and Gentles Fishes are very much taken with; Anglers use toatten these to their hooks to catch Rock, Perches, Carp, and other fish withal, very good they are for that purpose especially if preferred in honey. Trouts are taken with the ground or Gaipath Fly, but chiefly with the dung Fly; so that the Anglers use toatten one or two of them to their hook, and with a sporting, or rather cunning fetching back of their line, do invite the Trouts more greedily to bite, and the bait being swallowed, do hang the fisher. Others put as many of those flies upon their hooks as they will hold, and plim them quite down to the bottom, especially where they know the greater Trouts use to haunt, who are very devisous of the bait to laied before them, and by their greedinece become a prey, and lose their lives; as William Benet informs me. The Fly called Purgantium (in English, the Cades Fly) serves for the like uses, as also the Fly which usually sits upon mans ordure. But every moneth must have his several fly, for that which is for one moneth is not for another; the which the Fishers very well know, who in defect of the natural Fly do use some artificial Flies made of wool, feathers,or divers kindes of filken colours, with which they outrun and deceive the Fifth. Only you must take heed that asoong as ever they bite, you pull your line to you, left the Fifth refusing the unfaavoury bait get away. In the River Aire stream there swim fifty divers colours feeding upon the native fly that flies on the top of the water, which when the fishermen perceive, they began to catch of those kindes of Flies, and fasten them on their hooks. Now these Flies it seemeth as soon as ever they are touched lose their native colours, and so become altogether unuseful to fish withal. Wherefore they are fain to use artificial ones made according to their shape and colour (as Aelian reports). They add also to the purple wool, and divers coloured, made into the shape of that Fly, two cocks feathers of wax colour, and so exactly resemble the natural Fly. From whence we conclude this art of making Flies to be very ancien, and derived to us by long tract of time; however we have some bold bragging hookmen at this day that ascribe it to their own invention. Nor may we wonder that fishes and fishermen do so lie in wait to catch Flies; when as Demitian the Emperor thought it a work not unbelieving Cesar himself; who as Suetonius faith of him, with an iron pointed instrument stab'd all the Flies in his Chamber to the walls, as they stuck upon them, and would not leave so much as one; inform'd that when it was asked by any who was within with Cesar, the servants anwered, Ne muus a quiddam non so much as a Fly.

But how strongly do those inferm creatures demonstrate the great power of God? For consider but the leaf Fly that is, and observe how in so little a body the most high God hath curiously fitted feet, wings, eyes, inous, and other parts, which yet are lefe then the leaf thread. How doth he out-fly a Fly of his own name ten times bigger then himself? doth he not excell all other Flies in running? doth he not pierce deeper with his inous, and draws out whole vellifels of wine? The Elephants, that great monster of creatures, is often vex'd and molested with other Flies; and that they are able to tame the Lions, Asp shewes in his elegant Fable, The Horse, and Bear are not able to endure their bites much leffe then the Sheep, and Asses, unlefe humane prudence came in for their aid, and did prevail against them. Hence came the invention of that which some make of Leathers, rubbels, or birds which we call a Fly-flap: and that orbicular fan fastened to a Longflick made of the most choice Peacocks feathers, of which Propertius of old, makes mention in this Dithich:

Lambe que turpe prohibet tua pranda Muscas,
Aliti excipiar, cauda superba sors.

That
That is to say,
That which forbids the nasty Fly thy肢 to lick,
Is Peacocks feathers fastened to a stick.

The Indians and Germans make thes, the one of Oxen, the other of Foxes tails. Some make them of small willow twigs, others after another manner: the fathion whereof, Ovid, Vegetius, Columella do exactly describe. Moreover, whereas the rugged skin of the Elephant is in stead of tail, mane, hairs, (to speak in Pliny's language) neither hath he any bristles to cover him, or tail to guard him, therefore men cover him all over with linnen or silk, the better to free him from the irknomnele of the Flies, and to keep him safe that they may not come at his skin.

That Oxen and cattel be not annoyed with Flies, anoint them with Oyl fried in a frying-pan, or with Lions great, and Flies will not settle on them. The same will Origamum or wilde Marjoram effect, if rubbed till it be timber and spread upon them. If you anoint the hairs with the juice of the leaves of a gourd, you would not a little wonder how it will free them from Flies, this I have oftentimes made use of with profit, Selaricus, Bay-betrees being made into a very small powder and boyled with Oyl, have the same virtue, if they be anointed with them; as also the drivel or oint of Oxen and Horses, Africamun.

Oftentimes Flies get into the wounds and ulcers of cattel, so that by reason of the worms which they breed, there is added more malignity. First of all therefore, those ulcers being made clean, Columella applies an ointment made of Pitch, old Oyl, and Bacon grease, both within and without; afterwards he applies Whey wingled with Athes. Almost all the Summer long the ears of dogs are so exacerbatet with Flies, that they often lose them quire. The which that it might be helped, they should be anointed with oyl.

The Fly Ophiusurus (from exiting or devouring of Serpents) gets close, Actios, between the scales of the Serpent Dryniam especially, in so much that at length it kills him outright: this Fly from the colour of its wings is called of Helychius xanumun, or the Broken fly, because it resembles the colour of brasse, it feeds on black Beetles; and by biting buggers in the Serpent extremeity of heat, after that unquenchable thirst, and death follows: having fed upon the carasses of those Serpents, if afterwards they happen to bite a man, the wound is incurable and deadly.

The Flies called Mariduera or Dung-flies are of divers sorts: one is like the Fleth-fly but bigger, his eyes of a darkish red, shoulders black, in which there is a circle somewhat long and white; the back black drawn over with crose lines or streaks. The wings silver colour, longer then the body; most commonly they are seen about mens excrements, feldome otherwhere. There is also a Fly green all over, so repiquent and glistenting as if it were transparent, the head dimmish silver wings, frequently in the woods, and most commonly about dung; in bignesse equal to the common or ordinary foot of Flies. Whether it be that which Situations calls Cinereus. I know not. I have light upon another Fly called xenos, Dung-eaters lefte then the green Fly, the body dun, the head of a full red, with a line along the middle of it, I have another the body rough, yellowish, the eyes black standing out; the shoulders and back black, curiously spoted, the tail ash-colour. Another fly there is white spots, somewhat towards a Saffion colour; it hath two horns longer then the rest, silver wings covering all the body; the head black, foursquare, and small, very frequently seen about horse-dung. To conclude about dung-flies (from whence also it is probable they are generated) there are certain yellowish Flies, the body somewhat longer then the rest, and bunching up; of whose generation we have before made mention. Alto I saw another rare Fly, not every where to be met withal, that feeds on mudwall made with mud and purfhefd materials, it was black all over, only it had silver wings, and in the shoulders it hath four white spots; in the rest of the body eight, i.e. on each side four; the eyes white, the forehead marked as it were with a white alizarin or little star; out of which shoot out two black horns and long, it hath also upon the top of the thigh or shank a little white spot sprinkled up and down, This Flies I keep though dead, in a box for the raritie of it. Bembidophagus is a Fly, montanous, big, very black, the body rough, the eyes somewhat long, great, the head of a bright red; for his prey he falls fiercely on the Humble-bee, and getting the better of him by flight, nimblly gets upon his back, and flicking close to him, doth to extremely bite, that he throwes him headlong to the ground,ucks out what honey he findes, and goeth away conqueror; on the top of Carmel hills Pennius affirms in his powers, that he saw it as long as the flight lasted; but the fortune of the barret falling to the Flies, the Humble-bees were put to the worst and flain. And thus much of the Zoephagi or the Flies that live upon living Creatures.

The Zoephagi so called, are those that make their living out of creatures without life, and those are either on the land, or in the water: of the land Flies, some feed only on the earth and the dew of it; others of plants, herbs, and flowers growing thereon. The one I call (in a term of my own) Ground-suckers Hunnifaga; the other, Hearb-eaters, Herbivora. The Hunnisga, or Ground-fucker, hath a dun coloured body, in the head toward the mouth, a whitish shining spot, the belly and feet black, at the comming forth of the wings on both sides a white spot, the back grey, in the shoulders according to the length of them four fullled white lines, the wings silver, and (if they be put into the water) shining like the glo-worm; it is found in foot-paths, and Mol-
Mole-heaps newly turned up; for it loves the ground that is made plain and smooth with treading on, and therefore called in English the Graspath Fly: it seldom comes upon flowers, especially at what time the Mole calls up fresh earth, of the juice whereof it is fattened.

Of the Herbwora or those that feed on herbs or flowers there are divers sorts or species; whereof three are like the Bee termed of Lucanus gallaris, military or war flies. In regard they are bigger, luttier, and stronger, very spicuous to look on, very gallantly set out with two silver wings. The first and chief of these hath a blackish head, the middle of the back being cut croflewife with two overwheat lines, the end of the tail black; the body otherwise mud colour. The second not much unlike, the head blackish, the shoulders according to the length of them drawn with three yellow and black lines, the rest of the body marked alike and with the same colours. The third and leaf about these, the shoulders are rough and yellow, the head red, the rest of the body is divided with four yellow and black lines going across it. The bodies of all of them do glitter, and as if they had nothing in them are transparent. They are incontinent in gardens, flicking the juice of flowers. Lucanus or these of these military flies thus: There are a kine of Fly which some call Military, others Dog-flies, that make a very harish and thrill noise, and fly exceeding swiftly. These are very long lived, and continue all the winter without meat, especially when drawn together, and fattened to ridges and tops of houes.

In whom this is most worthy of admiration, that both of them do the natural office both of male and female, like the Son of Mercury and Venus, who was of a mixt nature or Hermophrodite.

Much like to these is there another Fly called Apiarius, of a thinning black, having two wings, gathering wax, and fattening the juice that he hath gathered from the flowers to his hinder legs, as the Bee doth: He comes abroad in Autumn, and is seldom seen at any other time. Whether this be that which Arift. calls Sirenis; it differs certainly in the number of wings only, for that he makes to have four wings, whereas Nature hath afford this but two.

There are other sorts of Flies, that devour herbs and flowers, that are not like Bees, to wit, the Struthopesper, Euniperes, and Chelidonias, because it is like to the Swallow. Of the Strethopesper, I have seen three sorts. The first whereof is tender and sort, six footed, with two wings, the belly longer then ordinary, sending forth from the head a little above the eyes two feathers like Oftriches feathers, as it were horns of a downy softness, as soft as any feathers whatsoever; crump shouldered, all the rest of the body white, longer then the wings which are black. The second is of the same colour, whitish, the head of a dusky colour; otherwise it differeth little or nothing at all from the former. The third is all alike, only the horns are not so soft and downy; the tail is white, the body long, with five white lines going athwart it, the feet long, marked with black and white colours: as it goeth it lifteth up the tail a little, and softly clasps his two transparen wings together. These three species do appear in the Spring time with the first, in gardens, hedges and shady places very frequently before and after rain.

The Euniperes is a fly all over white or rather silver colours, small and every where downy; inasmuch as when it sits upon a flower, if you look not hard upon it, you would think it were a feather; the wings of it are divided, the feathers being forever one from the other almost like Birds wings. Pennins received one of these painted, from Edmund Knivet: afterwards he often saw them in hedges, and places fit with privet.

The Fly called Chelidonias, is twitter of wing then all the rest, sides, tail, head, brown and hairy, the eyes black and hanging out, the bill or rather the nose picked, out of the top of which that out two horns; the top of the shoulders as also the back black, two silver wings, the forepart whereof do answer to the blackneffe of the feet: sometimes it fits in one place for a great while together, as if it were immovable, but as soon as you come near it, its out of your fight before you can say, What is this? and will not yeeld a jot to the Swallow (from whom it hath its name) for twintwistle of flight. Pennins received another flower-Fly of the learned Carolus Clusius, black-having two silver wings, two dainty white eyes in the back, having seven yellow spots, in the midit whereof to be differed a peck of black. There are Flies that are found in beans, of fundry colours, but especially of a pale purple, which I conceive do come of the final worms called Mide. For when they are gone (which is in the midit of Summer) suddenly there comes forth a great number of those Flies swarming amongst the Beans, The Fly of Nepheus I have not seen, but those that come out of those black grains that stick to the stalk of the wormwood, much less thin Miller feel, more black than any Moor, only famous for their wonderful blackneffe.

There is a certain Fly called Tunzies, very rare and wonderful, whether you respect the form of the blackneffe of its life. It hath many names: Aelian called it Tunzies; Hefychius, Tunzies; of others it is called huegi* & in Latine, Diaria; it moveth with four wings and as many feet; for that it hath not peculiar to it in regard of the blackneffe of its life only (faith the Philosopher) but also as it is a four footed creature, and a flying creature. It comes forth with the Sun, growths flouriflieth, languiflieth, and dieth the same day with the Sun setting. In the time of the Summer Solstice, these diarie creatures break forth out of certain husks of putrefied grapes, which husks (or such as seem to be) whether they are a kind of Arelia proceeding from some kind of canker-worms living in the water, it is not ease to shew; for in that particular the Philosopher is silent, from whom most of this story is gathered. Pliny calls them thin membranes: Arift. small bottles, and faith they are common to be seen in the Rivet Hippes by the Cimmerian Bos- phorus of Pontus. They live a life both short and sweet, for they live nor beyond the space of a natural
natural day, and in the evening they put an end to as to their miliaries. In the mean while they are in full mood, and kept alive with their own radical doitfull, neither are beholding either to air or earth; hence we may gather the length of their life, yea rather admire and with for it. These insects Cicero speaks of in the front of his Inq. Ques. of Math. in his 2. Book de Sarmentia. Europea describes in these words, You may take notice (faith he) that in the Rivers of Romania and Litania, and the Princely islands and Bosphorus, in the Summer there are a great company of the Flies called Ephemerus or Day Flies: they be Worms and Flies both, some have four, others six wings; in the morning they run upon their feet over the water, about noon they fly about the banks, the fun setting, as many as were bred that day dye in the self same time, Which description doth much differ from Aristotles history of them, first because in the morning it is a creeping worms, then about noon a fly altogether, besides that he giveth to some six wings contrary to the minde of Arist. Jul. Scaliger in his learned Exercitation against Cardanus describes this Fly after this manner: I have observed a kind of Fly frequenting Sarcas and the Lake of Baccanum, called Ephemerus in the evening, but never any in the morning; being taken it lived only a night: it hath four very long wings, how many feet I know not; but if it have fix for (I do not remember how many it hath) it sufficeth, it hath a head like a fly, great eyes, the foot or beak rolled up together, the belly large, the tail exceeding long, and full of joynes, in the end forked, in some three forked, of colour a darkish, yellow in the biggest fcar, in the lefter of a brown or dimmiish, very specious. The Taurini call this insect Moniattes as they would say Manchelli, The Adriaick about Meramum and Trigoss, call it Cutuclen; of my Countrey men it is called Sitivola, i.e. Sagiella. Elah lib. 2. de Animal. sect. 4. sets forth another kind of these Insects, such as are bred of lowe wine Lees, which when the vesell is opened come forth, for nature hath given them a beginning of life, but in regard of the many miliaries to which it is incident, quickly freeth them of it, before they can be fensible of their own, or any others unhappines. But yet what those Flies of which Elian speaketh be, unless he be those that we call Bibiones? I know not; for that our Vintners know of no other bred in their cask.

But Scaligers Ephemerus, I should rather have reckoned amongst the Flies called paretis, had not he himself referred it to this Classis. I shall not think it much alfo to speak of Pennius his Triermes, or a Fly living three daies,for the likenes of the one with the other, that so the minde of the fudious may be filled with variety and rarity. It is of body very long, and fomewhat like a Butterfly, the head little and yellowish, the eyes great, black, flanding out of the head, the promenfis or beak winding in; of the colour of yellow mulelins, with which it lucteth dew from the flowers; two black cornicles shewen a little above the eyes, the back and belly yellow, the end of the tail dimmiish; it hath only four legs, the hindermost whereof are yellowish, the edges of the foremoft black, it hath as many wings as feet, the outermost whereof are pale, the intermediate borders of them being of a dark yellow, the innermoft of a brightish yellow. The outer wings when they are closed together for to cover the body, they are so conjuing, that you can hardly see a very hardly perceve where they touch; it flies heavilie and continues but a while in flight, within three daies it expires; it flies amongst Mallowes and Nettles, this was found by Poorborough in England in the year 82. witnessed by very honest men and without exception. Thus Pennius his Triermes.

In flowers, or rather the buds of the flower called white Bets, there is a kinde of Fly that ears the flowers, very small, I know not whither bred there, or coming thither from some other place, it seemes abide there for warmth sake and feeding. Pennius faith he was informed of this by his most learned friend Dr. Brown. I thought good to place the Fly Bibio in this number, because it is nourished by Wine, i.e. the clear juice of the grape (of which alfo it is bred). In the Illyrian Tongue called Finus robale; by the Germans, Wein Wurms; in the English, Wine Fly, Cardanus calls it Musculus; Scaliger not amisse, Vuvianum, and Virulium; for it flies into cellars of the houses, cares for nothing but wine. If you take it and look upon it, you would think it had no foot or beak at all, and yet it is reported that they will strike through a Cask made of inch board, infomuch that the wine sometime runneth all out. It may be Grapulius meaneth these, when he writeth thus: The Musculum, Muscule, Muscione, Flies bred in Autumn in the mother of Wine, and foiling the Wine cups, do not live so long (and that deferredly) as to come upon the table in the winter. In the Welt Country in a Town called Tanton, in the fruit of an Apple tree called Felus, in the Summer being rotten to the Core, there is found a glittering fly of a green colour; which when the Apple is cut in twain, flies out and seemeth to be bred there of some kinde of worm that is in it.

The wounds made by any of these Flies, must be anointed with bitter Almonds bruised, or Remedies 2. Walnuts; when ulcers are made, it is fit to pour on liquid Pitch boiled with Hogs-grease. Those things that kill and drive away the Tyke-flies called Ricinius, for the most part kill and drive away the Doe-flies, Columella.

The Fly also by his boldnesse and oarsenesse, hath taught men how to provide remedies against them; for whereas both at home and abroad, every where they were, to trouble some, that nothing could be so safely kept by the Cook, but presently they would be at it and spoil it, yes all kinds of meats whatsoever, they now use to fry or stuff up in their houses, or boil and mingle with such kinde of things as flies love, Nigela seed, Elder, Lawle, Coriander, Hellebores, Bo-gloffe, Borage, Sage, Beets; Loose-flitte, Origamum, Basil royal, Henbane, Licebane, Balm, a
The Theater of Insects: or, Book I.

fluff having a flower like a Rose, Pepper, Ferula, Cockle, Libbards-bane; some give them Orpiment powdered with Milk or sweet Wines, and sprinkle it about. Rhufis writeth that Crocodile Broth chafeth away Flies; who also commends the perfume of yellow Afnick, with Oilburning perfume of Vitriol, writing Ink rempered with water wherein Wormwood hath been washed keeps the flies from the letters. Plin. The feed of Henbane, black Elæebore, and the Froth o lá.

Quicksilver with Barly flower beaten and kneaded, and made into little mortels with Butter or Grease, and smeared with a little honey: and so cast to the flies kills them. Attius. The gall of a Hare mingled with mills, or boiled in water, and sprinkled about the house will chase away all the flies. Anonymus. Flies are destroyed with the smell of Wine diffilied with the herb Balm, Lullus. If you would gather flies together into one places, Ciff Rhododaphne well bruised into a ditch; the juice of the herb Ferula sprinkled worketh the same effect. Attius. Bury the tail of a Wolf in the house; and the flies will not come into it. Rhufis. Avius Albertinus. Boos graece and Rofin melted, entangles them. Oyl choaks them. Verdigrafe kills them outright. If you anoint any thing with Cafta beaten in oil, it will be free from flies. There is found in my Country (faith Petrus Crescentinus) a kind of Toadtool or Muthrome, broad and thick, reddish about the top, which fendeth forth certain knobs or little bunches, some broken, some whole; it is called the Flies Muttrom, because when it is made into a pate with milk, it deteories the flies. If a man hold in his hand the Stone Hercules or the touchstone, although he were clad all over with honey; yet will not the flies come at him, by this means you may know whether the touchstone be true or no. Attius. They write that the K. of Cambayes son was brought up by poppies, who when he came to years, was all over so venemous, that flies at once pierced were twon to death. Sealliger. If the fly get into one eye you may thar the other hand and it helpeth. Aphrodiasis in Problem. If Camell chance to be luing by the Tabanus or Aflus (a kind of Fly to called) as it often cometh to paffe in Arabia, mount them with Whales great and all forth of fhe, and they will presently be gone. Plin. Selon in Geopnsices bids thet to sprinkle cattel with the decoction of Bay-beer skin; and both these flies through a kind of natural antipathy depart forthwith, if cattel be already fling with the Aflus Fly anoint them with Ceraph and water. The Taban will die (faith Poranzus) when you fer them before them Oyl of the decoction of land Crudolages called Sciusibruido with Hoys sea and the flour of oot. Moreover let cattel be led to pafure in the evening the fars guiding them, in the day time let them be kept in folds with buuds laid under them, that they may lye the more early and quietly. Virgin. Or else let them be brought to the fides of thick woods where these flies by reafon of the dunecile of their fight cannot fly to freely. Sundry kinds of remedies against flies lullius upon Hippocrates also Apolodinus and Bri trim have preffed more remedies against flies.

Now after what manner Flies do execute the Justice of God, let us brieuely fet down. No Age but will fpeak of that famous Army of Flies; with which that great Lord of Holfs of heaven and earth did of old correct the fury of Pharaoh, and of the Egyptians, being joyned with hardneffe of hart; and yet the wicked Hypocrife did not come to himself; but wallowing still in the mire of fin without any fent, did afterwards invirte greater and more grievous judgements to fall upon him. And that proud young gallant, who would needs ride to heaven upon his winged ftead, dismounted and cast down by the Fly called Ostrum. Hercules also, although exceeding in strength, the Poets inform, that he was almost vanquifhed by flies. In the time of K. Rivallus, when as corruption of manners, and guilt had injected Britain, there came down from heaven fhowers of blood, and thoife being dried away, did produce swarms of paytoned Flies, who if they did but once bite any man he presently died, as our Annals report. Nicollus Albanopolitans an English man, being elected Pope in the year 1543. called by the name of Hadrian the fourth, was choked with a Fly flying into his mouth. Urfpergenus. Others fay that he was killed with drinking a draught of water in which a fly was drowning; and that by the juft judgement of God, who excommunicated Frederick Cefar, (Whose furname was Barbara, &c. &c.) and did incense all the Princes of Italy against him. Nauclerus out of Johannes Cremonas, An ancient writer reporteth also, that the Army of Julian the Apolite was grievously inftricted with mighty swarms of Flies; and Grifus fayth that the Magistant were by them driven from their habitation. In the year 1548, great numbers of flies dropping out of the air, did cause in the Eastern Countreys incredible noifomefle and putrefaction; upon which followed fuch a Plague among the people, that scarce the teth man among them was left alive. In the year 1549, wonderful fire of strange flies did fly up and down many Countreys, who did hereby waste the graffe, trees, cattel, and men also. Cranes. In the year 1143, a fort of fly about the bignefle of the common fort of flies, only of fomewhat a longer body, did fo fill the air, that for many miles togethe; the Sun could not be seen, which were also very troublesome. Urfpergenus. In the year 1285, Charles King of France leading an Army into Spains, and making war with Peter King of Aragon, an Army of huge flies of divers colours fett upon the French, and flew them with their beaks, as it had been with swords. Marinus Nicolaus I. I. de Hisp. Reg. In the year 1578, about the middle of Auguft, upon the top of the Temple of Bremhium, there fete every ear a swarm of flies which made such a noise with their wings as if they would throw down the roof. Timothy Bright told this to Renuiss, a Physician, a man both learned and verufius; and of no fmall note with us. Hither may be referred that which Seruus reports, lib. Georg. 3. That amongst the Romans a Plague did often happen by reafon of them, infomuch that they were fin to hire men of purpose to catch them, who were payed according to the quantity more or lefe that they caught.
Chap. 12.

Of lesser living Creatures.

cought. But how greatly they annoy the inhabitants of Africk, Asia, Spain, Italy, and the West-Indies, how greevously they fling and wound the Carthaginians, and the inhabitants of Hispania, besides Ovidius, let those Englishmen (by who accompanied that flower of Knighthood, and Mail of the Spanish pride, Francis Drake) as for those things which Apolloius Fulgens, and Pliny fabulously and superstitiously relate concerning Flies, I thought them unworthy of this place; and therefore those flies called Pisasides, Cyprians, Eldades, Alces, and the rest of mean invention I pass by, It shall not be from the matter to tax in brief the madness of the ancients Gentiles, that we may thereby be taught to lift up our eyes to the true Apollo, the God that doth indeed keep flies away from us. It is said of Hercules in performing divine Worship, whereas he was almost killed by the Flies, that he offered sacrifice to Jupiter, called Apollo, or the Fly-driver, by which means they were presently dispatched into the River Alpheus, from whence he was afterwards called by the name of Myricon or Fly-killer.

The Eons did invoke Myriones and Myades, that multitude of Flies might not cause a plague among them. Pliny, He relates also how the Cyrenacicks were wont to worship Acher the god of Flies, that by his means they might be secured from being troubled with them. Pliny more truly might have read this name Acron of Acheron, in head of Acher, if he had heard of the Town Acron where Babal-cubub, i.e. the god of Flies, that famous Idol used to be worshipp'd. Unfortunatis faith that the Devil did very frequently appear in form of a Fly, whereas it was some of the Heathens called their familiar Spirit Musca or Fly: perchance alluding to that of Plutarch:

His pol musca est, mi pater,
Sive profanum five publicum, nil clam illum haberti potest:
Liqis adsit ibi silice & ren omnem tenens.

This man my Father is a Fly, nothing can be concealed from him, be it secret or publick, he is presently there, and knows all the matter.

But away with those false and filthy gods which the Greeks therefore called yourselves, because they did serve for bugbears perhaps for children, and ignorant and heathenish people, which we that are Christians, and profess the true Creator of all things, ought not at all to regard.

There is also said to be another use of flies. For Plutarch in his Ars sacra relates that it was a law amongst a certain people, that whoever should be so bold as to laugh at and deride their Laws and Constitutions of State, was bound for twenty days together in an open chelt, naked, all besmeared with honey and milk, and so became a prey to the Flies and Bees, after which when the dotes were expired he was put into a woman's habit, and thrown headlong down a mountain; which place of Plutarch (by the Translators leave) I think should be interpreted not Cipho, but musca, anointed with sweet smelling ointment, Of which kind of punishment also Suidas makes mention in his Epicurus. There was likewise for greater offenders a punishment of Boat, so called. For that he that was convicted of high Treason, was clapt between two Boats with his head and hands, and feet hanging out; for his drink he had milk and honey poured down his throat, with which also his head and hands were sprinkled, then being set against the Sun, he drew to him abundance of stinging flies, and within being full of their worms, he perished by little and little, and so died. Which kind of examples of severity as the Ancients shewed to the guilty and criminal offenders; so on the other side the Spaniards in the Indies, use to drive numbers of the Insects out of their houses, as the custom is among them, naked all being dabb'd with honey, and expose them in open air to the biting of most cruel flies. But for these things let Nemesis arrive, who is at the beck of cruel mistress, yes may be said every moment to be preen'd with them.

To conclude; the last use of Flies (and that not to be condemned neither) appears to be this that whereas none of them palls a Summer, yet some of them do not live out a short day, we should by them be put in mind of our own frailty, and of the uncertainty of this vanishing life; the which although preferred with all the dainty food that can be got, with the finest raiments, and all the best wines and means that may be for a short space yet when it seems most to flourish, it on a sudden declines and scarce with the fly holds out an Autumn, much like a Winter: we are in Plutarch account but Musca, Daisemus, i.e. a's dures continuance, and as the dream of a Shadow. And with the flies, short liv'd, yet shorter liv'd then they, for the most short lived of them liveth a day, whereas we have young children that survive not sometimes the fourth part of an hour. Away then thou Tyrant whoever thou art, make laws as thou pleasest, persecute the godly, add impudence to thy strength, trouble and confound all things, give thy self up to all abominable and filthy lusts: yet at length Jupiter shall scare away these flies, and after thou art dead exercise thee with variety of torment.
The Theater of Insects: or, Book I.

Chapter XIII.

Of Gnats.

The Gnat is called in Hebrew Arish. Hesoi; in Italian, Zancola; in German, Mack. m. 'Uch feh, Nach, Hunger flacks, in Flanders, Mejien; in Pomerography, Komorr, Welochomor; in Muscovy, Comor; in Spanish, Marquiste & molquiste, whence our teeman call it a Machomite; in French, if it be lefter, Monchoron, it greater, Bordelle; in English, it bigger, a Gnat, if lester, Midge; in Latin, Culex; perchance from its fling as Iphar, faith, or from the word cuanum which signifies the fame with corium a skin, but if I might be bold to give the Erymologists, I should rather read the word cuicmum, not culceum, a skin fly, because it most affects that: whence by way of Hieroglyphick it signifies a Laconer; because as the Gnat covers the fairest skin, and strikes till blood come forth, do both the Letcher; which Plautus seems to intimate, when as the Parafite, if I am not deceived, takes up an old fornicator for killing his mistress too hard after this manner: 

Eho tumibili, cante culex, &c. What! art thou not ashamed thou gray-headed Gnat? I can scarce forbear to tell thee thine own.

The Greeks have no general word that comprehends all kinds of Gnats; as on the other side the Latines want words for particular Gnats, with which the Greeks abound. Of the Greek words, Arish. seems to be most comprehensive, whence the Oetecnai worshipt Hercules by the name of Cronus, because he was thought to have driven all the Gnats out of their Country. The fame Alexanderinus wittener that Apollo was called in Attica Culicis. The Bocanai worshipt their god by the name of Apollo Paromias, because he drive away their Gnats called in their language, 

m^pouss, so Panstias. But since the Greeks have one herb they call xantam, i.e. Culicaria or Gnatbane, a remedy against all farts of Gnats, xitpa doth indeed seem to be the most general word. That is evident by the network cover'd spread on beds, taken from the Greeks which they call xantamin, and also at this day name not much unlike, a canopy, a thing to catch all manner of Gnats.

The Gnat seems to be a kind of Fly, yet as flies love sweet things, Gnats love things savorv and tart. The Flies do couple, the Gnats do not. They are most troublesome in the day time, these in the night, they make a kind of a dull humming noise, these fink furill, loud and pleasantly.

The Gnat hath two wings, for the bignes of his body great, coming forth of his chomp foulders, he hath fix long crooked ambiling legs going in and out, growing from his prominent square fquare, with which as Arish. faith, they with the more eafe lift up their bodies and go the better; he hath a very long body, as also a fnow or proboscis three times as long as the Flies have, with the sharp point whereof he breaks through the skin, and with the hollownes of his trunk he ficks blood, which he makes use of in head of a mouth and a tongue. Pliny. He makes a terrible sound and great, for the bulk of his body, so that Homer in his Batrachomyomachia, makes them to give the signals for the fight. Aristophanes in his Naubian derision of Socrates, brings in Chremiophas demanding whether the Gnats make that found with their mouth or with their tail. Yet in his Arisides he terms them vovoua, which the Scholiait expounds vovouetia, fowl fouging. Their Proboscis (faith Pennius) seems to be given them by nature to suck blood and to feed themselves withal; but we may not afient to him in this particular, even reason is againft it, for that the Gnat when he turns roundes one fings much flill, but in turning away more flat; which could not possibly be, if they were found with their tail.

The structure or make of the Gnat there is no man but with Pliny may juftly admire. For in these so small Insects and as good as none almoft, what reason is there? what force? what inexpressible perfection? where hath nature placed fo many fentries in the Gnat? where his fight, where his taste, where his smelling? where is begotten that terrible and great sound which that little body makes? with what curiosity are the wings faftened, and the thongs and legs to the body? an empty hollow place for a belly which caufeth such a thirst after blood, of mens especialy? but their dirt wherewith they pierce the skin, how sharp is it? as in the biggest it cannot be perceived, so it is doubled with reciprocal art, that it might be sharp to break through the skin, and fifulous to suck the blood.

Their manners and conditions are very ill disposed, both in regard that by their good will they will wound none but the fairest; and alfo those that are asleep, harmefle and thinking no hurt. Whence groweth the proverb, a very ill conditioned man, that he is naivam ciuanam, more mischievous than the Gnat. The Gnat certainly is a very mischievous little creature (to use Ehliani language) annoying men both day and night, both with his noife and his fting; espeially those that live near the fens or rivers. Of whom Tertullian against Marcius, and his fifth book speaketh thus: Endures, if them be able, the trumpe, and launche of the Gnat; who darst not only offend the ear with the forftiness of his found, but with his lance strikes through the skin, and venin alfo.

The diftinction of Gnats is very perplex and obscure, it hath puzzled all the Philosophers; which with the doubtful fentence of words in Authors have almost confounded the things themselves. But so much they seem to differ especially in magnitude and malignity. For there are these few sorts of them, the bigger, leffer, middlemole and leaff.
The bigger may be called araneus, because they have their abode in fenny and marsh places; there they are begotten, and there nourished, they have a very long, slender body with two wings, which never lift up above their body, as the fly doth, but straight up from their shoulders, and those are very near, polite and compleat, as may be.

They abound in woods that grow near the sea, and the fens, not only in norway, Engla, and other extreme cold regions, (as Olani Magus hath observed,) but in the west Indies in Hispanio-...
matter to thew where in many things he is out. Why doth he translate the Empides Maliones, who are said not to live above a day, and feed only upon honey? which must needs be hard for them to get ready in Fens and Marshes. For I may well call (without wrong to the judgment of Pliny or Penn) the Maliones as they call them Maliones for they neither care for Milkes nor feed on them, but only upon Honey, the which they can smell at a great distance; they have a bill like a Wood-peckers, long and sharp, with which they devour in honey so greedily, that at length they burst their bellies, and so presently expire. In this also did Ceres trip, to say the least that may be, that he translates the word Afcrides by the word Tippula. For the Afcrides (whether they come forth of the earth, or the water, or otherwise) every man knows do fig-mine little worms. Besides, the Tippula alwaies keep the top of the water, feldome or never go down to the bottom. Last of all, when as the Tippula themselves come of the Afcrides, who can rightly say that Afcrides are the Tippula?

'Flour, is called Culex fircarius i. e. Fig Gnat, not because it comes indeed from the fig-tree, but because it is fed and sustained by its fruit. For it is sprung of a certain worm that breeds in the Figs, which when nature cannot make her perfect work upon, nor bring to the sweetnesse and perfection of other Figs, lett she should make something in vain, by a certain quickening vertue, out of the grains of them being rotten and purfeated, she producestheese Gnats. Yet not so, as that the Gnat is the mother, or besides the intention of Nature (as Scaliger hath learnedly observed) or if he be, the truth, is the work by the bye is of more dignity than the main. Nature did propose to itself the perfection of a wilde Figs, a thing not so much to be esteemed of: this the being not able to bring to palfe, turns her self from to common a works, to an enterprise of greater weith, and producestheese Gnats which she effecteth. Concerning these Gnats Pliny hath the words: the wilde Figg-tree brings forth Gnats, these being defoured of the nourishment they should have received from their mother, being turned to rottenness, they go to the neigh- bouring Fig-trees, and with the often bitting of the same fig-tree, and greedily feeding upon it, they let in the sun wihall, and set open a door for plenty of air to enter in at. Anon after they destroy the milky moisity, and infancy of the fruit; which is done very easily and as it were of its own accord; and for that cause the wilde fig-tree is always set before the fig-trees, that the wind, when the Gnats fly out of them, may carry them amongst the fig-trees; who aflone as they come into them, the figgwell and ripening of a sudden grow very big and full. Whence it is that the Greeks to express a woman great with childe and near her time (yea or newly conceived with childe) call her Fig-Gnat, or Gnats-bitten. Those kemb'd and curle locks Pathick's and pro- fuitutes of unnatural lust, were called from hence Capsificats, as witnessthe the Greek Lambdaic, this words Πάπεριζ Περικις Καταρακτίζων λείψανα (means to make a word) Πάπερα καταρακτίζων. Nemo componit nisi Capsificatiss. There is no man that curls and trims his locks that is not Capsificatiss. To this Capification Turnebus thinks that Adrian the Empe- ror did allude, when he upbraids that alternate Poes Flores with his Pathick, obstinately under the term of round Gnats in a most bitter Sarcasm:

Flora had fain,

Egg solo Cefar effe,
Ambulare per Britannos,
Scythians pas primias.

To whom Cefar answerceth,
Egg solo Florus effe
Ambulare per Tabernas;
Littarque per popinias,
Culices paet roundus.

In English thus:

I would not Cefar be
To travel Brittany,
To suffer Scythian cold.

I would not Flora bee
To walk the Tavens free
In Slacking Brothels hid,
Or the round Gnats abide.

But what time these Gnats passe from the wilde fig to the fig-tree, they do it in such haste, that many of them leave either a foot or a wing behind them. Now that they generated of the grains of the unripe figs may be evident in that the wilde fig is left void of grains.

Caps (some call it auct.) is called of the Greeks, and to wicin, from biting or stinging, (for that the twinge the fleshs, and with their biting cause an itching in the fame) is a very small Gnat, not unlike the Conops, who although by his biting upon the Fig it may seeme the same Gnat (spoken of before, called Cyfa: sein: unica et to dixo (as Theophrastus faith) e tē βετον την oλίγην ετέρην Πηγην δρακών) but she (as he saith) is the very first of vipers. Which place Pliny interpreteth thus: There is a kinda of Gnats very offensive to certain trees, as to the Oak, of whose moisture that is under the bark, they are thought to be bred. Theophrastus calls all those worms, what ever they be that are bred in the Elm, Neter, Roper Poley, the Masicky Tarpetins and other trees, either with parafaction or otherwise. There or the like, but a little bigger, Curies in his 13. Book, faith are very hurtful to the orchard Wal- nuts, which are called of those of Lions, Bordels, Bordists. Galens opinion is, they are great devourers of Grapes. The moisture of the Elm included in its first growth in the leaves or rather blad- ders, if it dry up is charged into those Caps. In the Aurora it brings forth other kinda of Gnats, many, small, and black, called Conchures, Sympyrions. They do especially haunt and spoil watered gardens, the crop and scrap most kinda of h.e. Filarandus infestus, an Apothecary at Lions.
ch. 13.

Of lesser living Creatures.

Lions hath observed them very frequently to come forth of the middle or heart of the oak apple, having a hole made therein as also out of divers other herbs, not so much by reason of purance, but rather out of the alteration of certain principles being digested into a better nature by successive labour.

Origen upon Exod. saith that with these little creatures God did the third time take down the proud heart of Pharaoh: the which are hung in the air by the wings but yet as it were invisible, and do sofacility and quickly pierce the skin, that the fly which you cannot perceive flying, you may feel stinging. So all the ancient interpreters following Origen expand the word nemus.

Only Tremlus (a very faithful interpreter of the Hebrew text, and of sacred Writ) is of another mind; who thinks this plague to be swarm of such kind of creatures, as if the Gnats and all other venomous and stinging flies consisting all their forces and coming together in troops and swarms, had agreed as being sent by God to break the pride of the Egyptians.

They fly in the air aloft in manner of a Beesflk or Pyramid; especially in the evening, they play up and down by hedge fide, when it is hot and fair weather; they fly in the sun-beam against rain in the shade. It may be they are the same with those we call Midges, and doth not much differ from that which Aristarchus calls Schoggen; the Italians, Zenzalus; the Hebrew, Cishus. There is a kind of Gnats which the Greeks call voude vaiontes; the Latines, Hercules; in froth and malle like to Drones, and never would or hurt any but those of their own name and alliance; for as soon as they perceive other Gnats full of blood and moisture, after they have fought with them, they take them for their prey and eat them; whereas they live idly and do nothing else but seek for their food gotten by the labours of others. Our Ancients have observed a kind of Gnats to be bred in the Lowe Leeds of Wine. Which because they are not heard to sing or make any noise, I had rather think them to be those which Scalliger calls Fumile Musculina; Wine-flies. Not do I praise for the opinion of Niphus; in regard they, like some other things, and refuse sweeter: when as he himselfeth elsewhere, that they are fed chiefly with the juice of Oxen dung, than which nothing can be more sweeter.

The English Gnats are not so stinging as others, nor do they raise so great pimplses, but the lesser sort of them is the more cruel, and yet they have nothing behind them but a little itching spot, like aatisfiting. The Gnats in America, especially those they call Trinm, do so thot and cut, that they will pierce through very thick clothing. So that it is excellent sport to behold how ridiculously the barbarous people when they are bitten will sigh and trisik, and leap with their hands behind their buttocks, shoulders, arms, sides, even as a carter doth his horses. The Gnats about Terra insignis, or New-found-Land, and Port Nichols, as also in divers other Northern parts, are to be seen in great numbers, and of an extraordinary bigness, as the Seamen and Olaus Magus affirm. The cause of their multitude Cardanus attributes to the uninterrupted heat and the length of the day. The cause of their bigness to that watery and inunctuous moisture which was gotten together by reason of the long cold. But forasmuch as in the hotter parts of the Indies, as Oceiana (and experience) teellus there are altogether as great, and many more sorts greater and more, Cardanus may well satisfy himself, though he cannot do me.

Of the Generation of Gnats Nature secretes do diversly diquire: Albertus faith their matter is watery vapours. Aristotele denies that Gnats should be generated of Gnats unlesse by reason of Gnats: means of a little worm as Flies are. But since they do not use copulation, I do not perceive how that can be. Piersius was the first that taught how that Gnats do come of certain worms breeding in wood, when as yet every man knowes that Gnats are produced of worms in the New, Priests, Maulicks, Torpentes, mild Fig-trees, and other like Trees, if fed were fown; and that not by way of purance, but animation.

I did chance to finde (faith Brunsch) in a dirty filthy ditch an Insect with very long feer, which for the likenesse of the form, you would say was one of the larger sort of Gnats coming forth of a forre letherish purie. I did imagine that it might be bred of some worm like unto the canker shitt within them; for the shell within was such as those the cankers transform themselves into; Whether it should be called Calum, a greater Gnat, or Eriplis, it is doubted by the Author. To these (as to all other the like hurtfull Insects) the mercifull Creator hath granted but a very short life, incommun that which they which are bred in Summer never live till Winter, and they that are bred in Winter never see a Summer.

Yet notwithstanding God hath created them for divers use, whether we respect God himself, The Ufe of other creatures, or our selves. For not only Mygnetts, Mygni, Alhabarani, Archeturfcs Gnat- vics, were by the very commandment of God, driven out of their cities into deserts and solitudes, as Pauwlians Lees Afor; Alisans, and the Indian histories relate: but even the Egyptians Tyrant, of all that ever the earth bred, the most cruel, (as the sacred Scriptures that are more ancient then all the Heathenists) was vanquished with an Army of these. The left of those the Pope could not rid out of his thorat, but was with one of them miserably choak.

With what a khitenece did they charge the Army of Julius the Apostle? how did they make him turn his back, and fall down dead? Let Apostates from the faith confeder, and weigh the matter well; let them think more seriously of the strength, power, and majesty of the Creator, when as they see such cruel things and more sharp then any poynard whatsoever, to be in such an abject contemptible creature as this is. Neither doth God make use of them to punish wicked and godly men, but also for the preservation and safety of mankind. For about Merg and Alhabaram,
Alhabersz. as Strabo reports, so great is the plenty and freeness of the Lions, that unless they were chas’d away by a great kind of Gnats (that troops up and down all that Region) they were not able to live in safety, not in the most fenced Cities from their invasion. The same is wont to happen in some parts of Mysopotamia, as Ammianus Marcellinus writeth, where the Lions being lured with the Gnats, and defrayed of any remedy against them, throw themselves headlong into rivers, and are drowned in the deep. To the Egyptians also, although sometimes they were deadly enemies, yet are they now auxiliary to them, as Hecataeus writeth, in that they wound and sting to death the young Avides, before they get, feathers being noxious to them. Moreover, were it not for them, the whole species of Bats, Water-Frogs, and Bank Swallows which prey upon the Gnats and feed only upon them, would perish. But where is Gata faith that the Bird called Cnipholugus (a kine of Wood-picker with an all-coloured back), doth eat Gnats doth not agree with their nature. For that kind of Birds feeds on a little worm that bredeth in the rotten wood, called Cofius, the which he picketh out with his bill; He was received it seemeth, by the Amphibology of the word, which signifieth both those Worms, and Gnats also, for so are they called in Greek short. But if there were such a Bird I should affirm without all doubt that it is the Nectar, which by Hesychius and Varium is called Komphathera. The Gnats called Iemis do cause Figs to ripen, by taking away their milky moisture, and by bringing in the Sun beams with them: and for that reason in those places where Figs do grow, they are bred in the wild fig-trees, that from thence being blown with the wind, they may light amongst the fig-trees. By which words of Hirtz it is manifest that Capiitation is nothing else but, a certain skill how to cause the Gnats when bred in the green or raw wild Figs, to fly to the Figs, that by the waving of their milky juice and moisture may bring them the lesser or more plenteous nutriment; The which is brought to paffle into manner of ways; for either the wise fig-trees whereof so disposed round about the fig-trees, that wind might blow them thence unto them, or else wild Figs being gathered altogether, and bound together in a bundle, were cast into the trees; and therefore the little bitte like to a Beere, called in Greek vlygos, with his noise staring away the Gnats, and feeding on them if he catch them, the Fig-keepers are wont to chase away and destroy.

The Gnats also seem to be more worthy elusive than the ordinary sort of Almanack-makers; for they will resell you the weather at all times for nothing, and that more certainly and truly, than they which boast themselves born by the Tripos of Apollo, and a long while brought up at Cuma. For if the Gnats near Sun-rise do play up and down in open air, they prefigure heat; if in the shade, warm and mild showers; but if they altogether fringe thereat, that pale by them, then expect cold weather and very much rain. When a Gnats comes forth of the Oak-apple about Michaelmas, it foretells war and hostilities; if a Spider’s death, it’s a worm, fertility and fruitfulness. Mizald. If any one would finde water either in a hill or valley, let him observe (faith Panano in Geopon.) the Sun-rising, and where the Gnats whilest round in form of an Oblisisk, underneath there is water to be found. Yes if Apomastres deceive us not, dreams of Gnats do foresee news of war or a danger, and that so much the more dangerous as it shall apprehend to approach the more principal parts of the body.

Upon a certain time there was seen in the air between the Monasteries of Sion and Shene in England, such a pitch'd barrell of Gnats, that you could not see the Sun at mid-day. The light was maintained for four hours, as long as the Armies could stand; at length a mighty slaughter being made on both sides, so many dead carcases of Gnats we found in the hedges and high-ways, that they were fain to sweep the corn fields and meadows with beecombs. There followed upon this the banishment of the Monks in both the Monasteries. Stew. Whether this be true or no, I leave to those who can resolve such truths; I proceed to that may be of more certainty to be taken notice of.

Of great use are the Gnats unto us, when as the Fish called Thyphilus (as Athenæus writeth) can be taken with no other bait than with Gnats. But as they are sometimes useful and profitable, so are they to: the mort part very inkomone and troublesome, wherefore nature and experience have taught us remedies against them. To which end you may make a Fumigation or Powder of Pomegranet Figs, Chamxleon, Thistles, Lupins, Wormwood, Grift, Pine, Fleabane, Elecampane, Cedar, Radift, Cummin, Rue, Hemp, Dung, Galbanum, Calerorum, Fever-foote, Hare-scrobut, Goats-hoofs, Elephants dung, Balmstone, Sulphur, and Vitirol, which will drive them away.

There are prescribed also these compound receipts: to take roots of Elecampane 1 dram, Ammianum-, Chymiamus-, Thym即是, of each 2 drams; burnt sheil 2 drams, put all these into the fire and perfume your clothes. Another; Make powder of Harts-tongue, and with Vitirol perfume them. Another; Take Wine-les dried, and Cenece, of each alike, with Copperas and Ox dung, perfume them. Another; Take Vitirol, and with Harts-tongue, and with Cummin ground and with Ox dung, &c make them. Alfo the vapour of very strong Vinegar, and of Origanum, doth chase them away. Another; A Sponge dippt in Vinegar and burn in the house drives them away. So Wormwood, with Radift Oly, by anointing preferve from Gnats. Nouv. Palladin advizeth to sprinkle new Brine and Soot in the chambers of the house. Rue dippt in a decoction of Fleabane, and laid in the several corners of the house, kills the Gnats. Ruhius. If you make a circle of green wet Hemp about the bed, Gnats will not trouble you. Geopon. If you anoint your self with Oyl, or the Manna of Frankincense, they will presently be gone. The trees that grow in wa
warty gardens, and plants infested with Gnats, are freed from them by burning of \textit{Galbanum} as \textit{Pliny} faith. But a prodigious, that I say not superstitious, remedy seemeth that of \textit{Rhagis} to be, I know from what \textit{Doricus} he had it, hang some horse hair and make it fall in the midst of the door, and Gnats will not come in at it. But why should Vinegar kill them, a thing which they naturally desire and thirst after? unless it be the vapour of that thing that destroyeth them by taking away their breath (as it often comes to piste) whose substance would nourish them. \textit{Apollonius Tyaneus} (as \textit{Teuctes Chil. 2. hath left recorded) did so order the matter that no live Gnat could come into the \textit{Cities of Antiochis} and \textit{Bitaniam}. But since we do not see how that should be done, the pests credit may be given to it. The Grecians have devised a kind of tent or covering in manner of a net, of linen, woollen, or silk; which being hung about their dining rooms and beds, kept the Gnats from entering in. Our Countrymen that live about the Thames have invented a canopy (the first that ever I read of) with lea colt, but the same profit, which they call a \textit{fen-carpet}, being made of a broad, plain, half dry, and somewhat hard piece, or many pieces together of Cowes dung, and these they hang at their beds feet: with the smell and juice wherein the Gnats being very much taken and feeding thereon all the night long, let them sleep quietly in their beds without any disturbance or molestation at all, being sufficient reward for their pains to taken. In the day time they are kept off with a fly-flap made of Peacocks feathers or other like things bound together; unless they be very numerous, and small Gnats, for then they will fly into the eyes, ears, nostrils, and mouth also, and taking greater courage to them, illing more sharply, notwithstanding these Remedies.

\textbf{CHAP. XIV.}

\textbf{Of Butterflies.}

\textit{The Butterfly} is called of the Greeks, \textit{\phi\textalpha\nu\zeta} the Latins, \textit{Papilion}, \textit{Ardoynus} called it \textit{Cam-}
\textit{pli}; \textit{Sifore}, \textit{Ariaca}; the Italians, \textit{Furcella}; the French, \textit{Papillon}; \textit{Papilion}; the Spaniards, \textit{Mar-
\textit{terflye}; the Brabanters, \textit{Capelugen}, \textit{Undere Fellerin}, \textit{Brother Ilie}, the English, \textit{Butterfly}.

The Bohfly is a volatile Insect, having four wings, not two (as \textit{Chalmautus Frierungski Description} dreamed) six feet, two eyes standing forth of his head, and two litter Cornicles growing forth from before his eyes: the Butterfly hath two forked beam or bills, and within those fork is couched another little bill or beak, with which they suck in, some the day dew, others the night. They couple sometimes with their tails averse, sometimes reflex; and continue long in the act of Copulation. They lay and gather their eggs, not little worms (as \textit{Arift} imagined) on the top and under the leaves, some great, some small, yellow, blue, blackish, white, green, some letfer then Miller feed, some twice as big, others just as big; according to the colour and natural magnitude of each Butterfly. These eggs being laid in a warm place, or being cherished and caused to grow in the day time with the heat of the Sun's beams, shoot for a Palmer or canker-worm, at the first all one and the same colour with them, but after wards as they grow bigger they change their colour. Out of some eggs the Caterpillars appear at four daies end, others do not hatch before fourteen daies, which by little and little get strength and fly, but weakly; yea some of them being kept from the injuries of cold and hard weather, endure all the winter, as experience doth sufficiently confirm in the Silk-worm. After copulation all the Butterflies do not presently die but live in a languishing condition, till winter, and some to the winter soule: the lighter and weaker sort of them are very short lived; the more strong and hardy continue longer; they appear in the Spring time, out of the Canker-worms, \textit{Auricula}, going by the heat of the Sun, and by the temper of the air being in head of a Midwife to them; they are brought forth. The coming of them is for the most part a sign of the Spring coming on; but yet not always, nor in all places. For although they be very weak and not long lived; yet while we were writing, that (faith \textit{Pliny}) it was observed that their blue was thrice destroy'd by cold weather coming again; and strange Birds about the 6. of the Kalends of February gave notice of the Springs approach; but a while after with a cruel bitter winter weather that succeeded, they were all destroy'd. We ought not to wonder that those foolish \textit{Icarus Aftrologer} having no ground for what they say, do tell us that which is false; whereas it doth appear by this, that Nature her self is insconstant; and we being more addicted to second causes than we should, and being impatient of the first Mover, are deceived by her. \textit{Peninus} reports two swarms of Butterflies in one Autumn. Now although I do no deny that long and sharp frosts they may all die, yet they are able to endure moderate cold, and do live in warm places even in very cold sections. For how commonly are they found in houses sleeping all the Winter like Serpents and Bears, in windowes, in chimks and corners? where if the Spider do not chance to light on them, they live till the Spring. \textit{Arift}, saith that they all take their colour from the worm they are bred of: but yet (if
The Theater of Insects: or, Book I.

Thus be granted; they have other colours besides, as will appear in their particular descriptions and histories.

They most abound in the time of Mallowes blowing, out of whose flowers when they have thrived in their in/out or proboscis they suck a sweet juice with which they refresh their bodies, Columbus in his Book de Nat. verum l. 9. c. 11. speaketh of the Butterflies thus coupling, and beginning on this manner: The Butterflies couple after August; after they have coupled the male straightway dies; out of their dung come forth worms. But all these things are so horribly strange that they have no shew of truth. For their chief time of coupling is in May and July: neither doth any Male of them die immediately after copulation; unless if be of that kind of Butterflies of which those Carerpillars come which are called Silk-worms. To conclude, those things he supposeth to be dungs be indeed eggs; out of which come not worms, but a great many little Cankers, out of whose caves come Butterflies.

There are so many kinds of Butterflies as there are of the Canker-worms: out of whose Aurelia they proceed. They differ generally in that some fly abroad, especially by night; these are called Phalaina. Others only by day, which are called therefore, Bicyclus, or Day-flies. The name Phalaina is a Boeotian and Cyprian word; fo for they (as Nicander the Stoic) wittell the name from the creature which flies to the candle, &c. The name of Nicolaus and Lycephon, will have shown to be taken for Phalaina of whom, because with the motion and force of its wings it oftentimes puts out the candles, is called Phalainopsia, from the roughness, and the bran and meal which seems to be spread upon it, it is called Jades. And because some of them are so far taken with the love of the light, that they burn themselves with the flame, they are called Pyranthe. There are those that interpret this Phalaina to be the Cicindela or Glow-worm; but not rightly; forasmuch as the Glow-worm never defiles the candle at all, but delights generally and chiefly in a dark night. The Germans call it ein Leicht mucken ein Leicht flugeln; the Helvetians, Flatterfchen; the Italians, Farfalla, Pavigioni, e Povina; our North-am also the Wort countrymen, call it Saulo, e. P. Schoen.; Animam, the soul; because some fiddy people in old time did fancy that the souls of the dead did fly about in the night seeking light. Nicander describes a Phalaina thus: which Hieremias Martinus interprets thus:

Consider what strange beings reside Memphis breeds;
One like a flying worm, by candle light;
Wherein he plays, as if he took delight;
Driven from meats, whereon at night he feeds.
His wings are narrow, of pale hue, not green,
But more like a bicoloured to be seen.

From these things therefore we may gather this description of the Phalaina, that it is a kind of Butterfly flying in the night, most defiers of enjoying the light; from whence it takes its name, of a body rough, its wings powdered or sprinkled as it were with a fine kind of ashes or dust; lying hid all the day time under leaves, or in some obscure place of cresses, in the night flying towards the candles, and by its too much desire of them reducing it felt into ashes: seldom or never it flies but with the wings standing upright on the back, as the contrary the day Flies keep their wings even with their body. Horns they have for the most part, either rough and large, or very little and short: but the day Flies more long and tiborous in the extremity of them. The Phalaina come out of the sheaths of the Canker-worm covered with earth. The day Flies from their Aurelia, either hanging upon or sticking into the boughs of trees. They are for the most part tough, and as it were dusty, flying in the dark, very tender; thence on the other side flying in the daylight, are more plain, smooth, even and have no dust upon them. They fly seldom in the day but toward the close of the evening, left the dust that is upon them being dried by the heat of the Sun and growth should shake off, being never used to be wet with rain. But these are not able to fly by night, lest the night dew should wet them quite through, and hinder both their flight and their health: wherefore in rainy weather and all night they throw themselves under the leaves, and never fly abroad but in clear and fair weather. The Phalaina are no little affected with the candle than these with the day-light: wherefore these rejoice at the day-star, that is to say, the Sun; but those at the night-star, to wit, the Moon, and Stars, and Candle-light, resembling somewhat the natures, splendor, and glimmering light of the Stars.

The Phalaina are all either very big or very little. The bigger sort of them have their belly and also the inside of their wings altogether of a fandy colour. The eyes seem blue, the head blackish; between the eyes come out two dusky coloured horns, Eagle coloured, with black crofe lines wreathed like a rope. Upon the shoulders there is a kind of fandy dusky coloured roll or welt; from whence a black crofe spot is drawn to the end of the shoulders. The body if you look on the backside, is of a bright blue or azure, if on the belly, it is of a fandy colour. The two outmost wings are very large and Eagle-coloured, finely set with spots and white circles, the innermost are fafle and yellowish, adorned in the inside with certain dusky streaks and spots; it hath thighs brawny and strong, all of a dusky colour, and at the end forked and black. It flies with a great noise, and being blinde
in the night, what ever glittering there
be aring of rotten wood, scales of
fish, or the like, it greedily followes.
As great Tyrants devour and spoil
theirubleeds; so those night-walking
Butterflies batter with their wings and
defroy those that fly by day, being by
night lodged under leaves.

The second Philome of the first mag-
nitude, as it is somewhat lesse in bulk
of body than the former, so far ex-
ceeds it in the gloss and splendor of co-
lours: as it Nature in adorning of this
had spent her whole painters shop;
and had intended the former for the
King of Butterflies, that is to fly,
strong, valiant, blackifh-freckled and
this for the Queen, delicate, tender,
fine, all bett with pearls and precious
stones, and priding it self in embo-
dery and needle-work: her body
downy like Geefe, somethings smooth
and hairy, like Martens or Sable skins;
the head little, great eyes standing one,
two cornicles like feathers, of a yel-
lo or bovve colour: the hath four
great wings, every one of them hav-
ing eyes of divers colours, the ap-
ple whereof is black, the circles or
roundle next to it of various col-
ours, with yellow, flame-like,white,
and black coloured circles, and semi-
circles. The outer wings from their
original to their extremities are
whitifh, beautified with certain lit-
tle veins and specks; the edges
whereof are adorn'd with a welt or
guard, and a hem of dunmifh or
dark yellow colour: the inner wings
brown or tawny, having one eye
apiece as the former, with a three-
fold border, the first whereof is
plain, the middlemoft part going in
and out like a focollop (both of a fien-
ly colour) the outermost of all of a
pale white, and as it were fown on by
some Skinner or Furrier, she goes upon
longe, fome brawny thighs, of the fame colour with the rest of her body. This did
Carolus Clusius fend from Pri-
ence, of fo elegant and notable figure,
that it is easier to wonder at and admire, than with his
expressions to describe.
The third hath a great body rough and blackish; each wing hath one eye, the light or apple whereof is black, the roundle brown, the half circle white. There are divers pieces in the wings of a wattre Amethjft colour; the edges of the wings at the first sight appear aff- colour, afterwards Eagle-colour. The head very short and little, putreth forth on either side a black eye, the apple whereof is of a notable whiteness, between those break forth two very small short horns of a dunnifh colour. It is be- gotten of a rough Canker-worm, not a smooth.

The fourth hath a great dark coloured head, out of which arife two straight cornicles somewhat black, the neck is adorned with vermilion specks, the breast rough, square, dusky, the shoulders coal black, the belly of Amethjft or purple colour, divided with five or six circles of rounds; the feet black as pitch, the wings of a light brown, full of long black little veins.

The fifth hath a white head, black eyes, the horns a little yellow, the outmost wings long of a fad colour between white and brown, the innermost being lightly and as it were by the by coloured reddish, the shoulders very black, the rest of the body somewhat of a rofe colour, bound about with seven black circles, a white line running all along the middle of the belly.
The sixeth hath head and shoulders rough, and the utmost wings drawn with blood colour lines, are a white brown; the eyes of the head standing out, of a violet or azure colour; the inner wings some what of a carnation, represent the eye in the middle part, shining with the apple crow black, the circle about it purple; the body like dried flesh, and a little smoky divided with six roundles black and brown.

The seventh hath the outer wings white, with certain brown spots here and there as if it were watered Chamberlet; the neck ring'd about as it were with a red skin reaching all down the shoulders like a Fryers cowle; the head is red, the eyes pearl colour, the horns flame colour; the innermost wings of a shining red speckled black; the feet red, the belly all of the same colour, with seven incitures or chits of a deep red lead colour.

The eighth is almost all over brown, but the edges of the wings and the middle part of the horns are of yellow or box colour.

The ninth is almost like unto it, but that the edges of the wings are like black sand, it hath horns broad and bended, of a whity-brown colour, the middle of the ouermost wings flopped with a round white spot.

The tenth is of a like bignesse, all over of a white brown, but that the middle of the ouermost wings is marked with a white spot, and the eye with a very black apple.

The head of the eleventh is tuberous, the horns slender, the body like clay trodden; otherwise the wings are all of a dark silver colour.

The twelfth somewhat of an ash-colour, the wings spotted black, the eyes black, the apple white.
The thirteenth hath very little or no horns at all, the body all over yellow, except the eyes (which are little and black) and the wings which are whitish.

The fourteenth appears of colour various; it hath black tuberous horns; as also the eyes and feet; the shoulders are drest with five white plumes as it were, of which the two middlemost have three black specks; the wings snow white, bespeckled here and there with black, yellow and blew specks; the body ruffet, articulate or jointed; the sides whitish, the parts her tail in or out as she pleaseth; the pleateth it is sharp, yellowish, jointed; all the body as it were sprinkled with dust; otherwise in regard of the tuberous cornicles it had come in the number of the day Butterflies. It layeth abundance of yellowish eggs, in the laying whereof she puts forth a little tail; which she puts in again at pleasure.

The fifteenth hath two black slender cornicles; the head and shoulders hairy, of a dun colour; the neck adorned with a collar of Vermilion, the fanks reddish; the outmost wings chamoletted with white and dun, the innermost are exactly redspotted with black spots; the body of a light vermilion, rounded about with six black guards, or wolts.

The sixteenth seems to be very rare: if you look upon it as it lies on its back, it seems to be all over of a murry colour; if as it lies, green and yellow; it hath five very red lines or streaks drawn along the shoulders; as also seven spots set quite through the middle of the back, do adorn the rest of the body: the wings also traverse with murry spots or shadows rather; the beginning whereof from the head to the bottom of the breast is terminated with a line of whitish or silver colour.

The seventeenth, when it goes upon its feet and its wings close to its body, looketh dun; but when it flitteth with the wings fletche forth, the innermost wings are carnation set about the edges, with a blackish lift or border: it hath very long cornicles, and the promiscus or fior doubled in or rolled up together; the gray shoulders are marked with round fand colour spots; the fide also, and all the joints of the body are set and edged about with hoary hairs.
The eighteenth being very rare indeed, was sent me by Clusius. The houses whereof pine colour, the head black as pitch, the nose crooked; the circle of the eye white; the neck scarlet or crinmion; the shoulders being rough or hairy, are covered as it were with a fable mantle; the outer wings decked with a white and black hem; the innermost red speckled here and there with black spots; the body black, as likewise the feet; but the sides of the body are set out on each side with seven blood-colour spots.

Like unto this there was another fent, but with the cornicles altogether crow colour; and on the middle of the shoulders dressed with a pure white lift; as it were with a string of pearl.

Of all theie the bodies seem to be of a great bignesse.

Now we shall adde to our discourse the middle sort of Phalena. The first of which is white all over; but only that the outer wings are bedawbed with certain black spots & freckles; and the innermost with very red specks and pimpls white in the midst; the eyes very black; the feet and horns yellowish; in fleed of a nose there comes forth a rough hair or bristle, the which is wound round up together like a roll.

The second, the whole body rough or hairy, and of a light red; and so are the outer wings; were it not for white spots, and hemis that go about; and yellow little eyes in them; the cornicles being yellow, are marked with black spots; the inner wings are of the colour of the marigold, but adorned with eyes and hemis like the former.
The third hath four white wings; the outer wings overcast with little blew veins here and there plentifully, and two round blackish spots in the middle; the line that is about the wings is yellow, and the comicles of the same; the head and body black, the eyes exceeding white; the sides of the shoulders are marked with four very white oblique lines on each side.

The fourth hath broad horns of crane colour, the body black, the sides gray, the wings yellowish, all over besprinkled with black spots like dragons, broad at the top, and afterwards round; the edge of the wings like the Bars flagged, and as it were prickly, all over black, within fix white specks; pearls being placed on each side do set it out.

The fifth is all over black, but that it hath pale reddish spots upon the wings.

The sixth hath the body and the comicles black, the eyes white; the wings are black underneath, above trimmed with golden hair & spots; to which are joyned black sides, run through with a silver coloured sheed; the outsides wings have a black border winding in and out, with gold laid underneath, and as it were wrought in and out with a needle.

The seventh broad horned, the black body waxing hoary; I know not whether I may count it for a discredit or a grace to it. The beginning of the wings are red, the rest yellowish, but each part embossed with black square spots and a golden thread running along the edges.

The eighth hath four comicles spreading wide, of ashl-colour, two of them very long and large in the borders; the body like the former, the wings of a pale ashl-colour, chequered with black, and painted everywhere about the edges with dots of the same colour.
The ninth, the head, eyes, corinicles, body, and innermost wings do represent the golden ocre; the shoulders and outermost wings are black, but only for a black border, having on each side of it an ash-colour line.

The tenth hath its body yellow, bedropt with black from the neck to the tail, both back and sides; the eyes, corinicles, and feet perfect black, the outermost wings white, but garnished with borders of yellow, black small studs, and spots likewise.

The eleventh if you look on the wings, it is snow or milk white, but only that it is all to bespeckled with little black spots; the shoulders also are white and downy; the body and back yellow, and joynted, having eight little black spots; the eyes big and standing out of the head, between which sprout out two black and hairy corinicles. In the night time she flies about the meadowes and pastures.

The twelfth hath its wings so long that it can scarce fly; it hath very short corinicles, little very black small eyes, all the body else is white, being here and there sprinkled with certain yellow veins and hairs.

The thirteenth (except its black eyes) is of a Crane-colour, somewhat blackish; the corinicles more than ordinary long, the body rough and hairy, the wings of the same colour with the body, but about the edges glittering with a greenish, glitih varnish.

The fourteenth is a very rare one, though all over almost of a sand-colour; it hath corinicles for the bounce of the body strong, black, and crooked like the oxe, the eyes great and black, the head fhort, the neck thick; the outermost wings adorned with certain black studs; the ridge of the back is dreft up as it were with five black heads of Gilliflowers, three forked.

The fifteenth hath its wings of a pale ash-colour all over, amongst all the rest it is ditinct of corinicles, the eyes are somewhat black; the back yellowish and set with five dusky coloured spots.
The sixteenth seemeth to be of the same colour, but that it is streaked with black athwart the outermost wings; but this is every where of one colour (except the eyes which are black). It hath a long body; jointed, four long narrow wings, six feet, those behind are twice as long as those before; it hath slender cornicles but growing out very far.

17. This comes of the Caterpillar of a Silk-worm, white all over but the eyes, which are blackish, and certain small yellowish veins running straight over the wings, and crofte the joints of the body: I call it the Silk-worm Phalena. Of which more in the story of the Silk-worms.

The leaf sort of Phalena.

1. In the Classis of the leaf sort of all, we shall place one and the first very admirable; going on four very black feet; it hath the outer wings azure, the innermost yellow, and the innermost (which is not usual) lefte then the outermost; the yellow body also is so big that the wings can scarce cover it; the cornicles are full of little points, and the eyes all but the fight blackish; the head and the snout (being long, slender, and rolled up together) are somewhat yellow.

2. The second appears blue and green, it hath a little body, the feet and cornicles blackish.

3. The third hath the shoulders and wings greenish, of the colour of leek blades; the body dunnish; the outermost wings are guarded with a guard (io) with white and dun spots; it hath a very little head, the feet and the cornicles ash-colour.

Moreover there are found in houses a certain sort of little silver coloured Phalens, marked with black spots, which fly to the candles, called Moth in English, which eat linen and woollen clothes, and lay eggs, of which come Moths, and of the Moths again these Phalens; they are said to come first of all from rose leaves and other herbs putrefying.

Three others I have observed in pastures and meadows. The first whereof hath the outer wings black, each of them marked with five red spots like blood, the innermost wings are all over red, the body dun, the head, short cornicles, and the feet blackish. The second is all alike, only that it hath but four red spots in the outermost wings, and hath a more slender body. The third is almost of the like shape too, but the cornicles are a great deal longer, and the red spots scattered after another manner; for there appear about the edges of the wings only two red blood-like spots; but from the rising of the wings two spots drawn at length. And thus much may suffice to be spoken of the night Butterflies, or Phalens; pass we on now to the day Butterflies.
The Day Butterflies are to be described after such a sort, that all men may see the fruitfulnesse and elegancy of Nature in this behalf and admire. For she hath not left played her part, or wrought hard rather in the variety of these, their colours, attire, rich apparel, roundles, knots, fluds, borders, squares, fringes, deckings, painting, making them; then she had done in the Phalanx.

1. The first Day-Butterfly being the greatest of all, for the most part all yellowish, those places and parts excepted which are here blacked with ink. Moreover, the roundles of the inner wings are sky-colour, infomuch that you would think they were set with Saphire stones; the eyes are like the Chrysolite: the bignesse and form is so exactly set forth in the figure, that there needs no more to be said of it.
2. The second differs very little from the first but in bigness; it hath nevertheless, very black eyes & longer cornicles, where you see the color white, there suppose it yellow, except it be those great eyes at the end of the innermost wings; the apple whereof must be made flame-colour, but the semicircle blond-red.

3. The third not much unlike in colour, but that the exuberances, and the outmost border of the innermost wings is sky or wood-colour; as also those three taches which you see painted under the hollow part of them.

4. The fourth may be said to be the Queen or chief of all, for in the innermost part of the wings, as it were four Adamant's glittering in a beam of Hyacinth, do shew wonderful riches, yeal almost dazzle the Hyacinth and Adamant themselves; for they shine curiously like stars, and do cast about them sparks of the colour of the Rainbow; by these marks it is to known, that it would be needless to describe the rest of the body though painted with variety of colours.

5. The head, feet, cornicles are of blond-red, but the eyes purple, the back black and blue, the belly yellowwhif, the wings at the hips of a bright yellow, and afterwards more fad; the utmost parts of them being nutty colour, and waxing blackish with an unpleasing daskines, are beautified with three little yellow spots; to the innermost being sprinkled with nutty colour, first two yellow, afterwards three pale yellow spots do flick. If you consider them with the face upwards, the upper wings are of a greenish yellow, marked with fix or eight spots, the innermost of a light grizzle-green, flained with two white spots; the belly and face yellowish; it comes out of a whitish Amechid, potted with little dark coloured spots.

6. The upper wings without are blackish, with a certain garn of a decayed red running through the midst; the extremities of them glitter with white spots and specks like drops, being sharpened with dark coloured notches round about; but in the inside that guard doth shew of a more clear and full colour, and toward the bottom they feem blue; the undermost wings appear of one colour without; of another within, without they are all over fad coloured, except a reddish border, with a prickly pude very small and blackish, marked with four little points, and two diverse coloured opals placed together; within they
they shew nothing like to this; but from a black and purl embroidery, they end in a fade fading red; the body is black, the eyeshorns,feet,all dusky and of the same colour.

7. The whole body is black, yet in every incision of the back, in hath two white spots; & wings between yellow and red, adorned with black and very white specks: but the bountiful Mother of all things, Dame Nature, hath chiefly beautified the borders of the wings, which have little teeth set like to laws at an equal distance one from the other, in the border whereof so blue buds pierced through with black lines, make a glorious shew.

8. Nature bred this with a chamblet mingled coloured coats, but it wants lively colours, for the wings are of a black reddish fading yellow and ruf fet colours, and it is more beautiful for its feath, than for its gallant apparel.

9. This is for the most part of an ash-colour, but if you look on the inside of the inmost wings, there is nothing that can better represent the wings of a Turky-cock; for the feathers that he flies withall, are covered by other feathers with scales; the eyes are black, as the horns are also, which are swollen like water-cats-tails.

10. The body is black, the shoulders are covered with yellow down, as is also the whole head; the horns are yellow alfo toward the head, which appears the fadder by a spot of a dark red; many round pearls set at just distances, do make the outward rounded skirt of all the wings to be more graceful: but within they are sealed with very black spots like lintels. But as the part is less comely outwardly, so the inward part of the inmost wings, shining with a whitifh green, with silver spots upon it, shines gallantly, and those spots that seemed outwardly round pearls, seem inwardly pure refined silver.

11. It holds forth a rare lift of oriental Pearls shining in blue, the upper wings being of a flaming yellow, new like fire painted with fix most black guards, the root of the inmost is black, then they shine from yellow to a fiery colour; the body is downy with darkifh hairs, and the horns and feet are of the same colour.

12.
12. It is wonderful beautiful, the wings are light blond-colour, dipt with black spots, they shine with small long beams dijerfedly drawn like threads to the very outmost of the coat, and this is adorned within with golden crooked lines like the Moon, being it felt a mutty, nicked on the sides like a Saw: the body is purple coloured from black, the eyes shine like gold, the feet and horns are black.

13. The body and wings appear black, upon the black wings, jagged in the circumference, but hairs grow, then borders, and lally golden fluds: also the small eyes in the black head are tinctured with gold, but the horns grow forth with spots white and black, and end with a small very black knob.

14. It much delighteth in the curiosity of the decking of it; the body is rough and blackish from white, a black eye, and a white papilla, about the bald eye you shall see a circle almost white as snow, the horns are the same with the former, the outward face of the greater wing is known by the flaming colour, golden lines being drawn upon it, with four dinted skirts; about the end of it three round pence set triangular, do adorn it. But the inward face of it seemis most pleasant with divers golden scales and lits put like a coat of male, and ryles of a house, also a golden line beautifies the utmost part of the wings. It represents a Peacock very much by its wings, and as that is, so hath it a proud and gallant body; the feet and legs are somewhat black, (left it should be proud of its texture) the snout is like a spiral line made up like a Maze.

15. This hath also a hairy beak wreathed up like a vine tendril; it is inwardly ash-coloured, and outwardly a faint gray, the wings are prickly, jagged like bats wings, some dun lines do outwardly part these, inwardly fix black fusdo much set them forth.

The outward wings of all are a dark green in fuchr, which some spots and pieces of white and yellow do beautifie; the inward are perfectly red, being sprinkled with ten most black spots, the belly flames with eight yellow cales, the back is red inclining to yellow, and the tip of the tail is a light blue. The rough shoulders are commended by a yellow Moon drawyn downwards, a white silver coloured apple makes the red eyes more sharp.
1. The eyes seem yellowish, the middle horns a decayed ruflet the wings and fort of Dryas, all the rest of the body are a pale yellow, the inward wings are marked outwardly with one only full yellow spot, but inwardly they are tintured with a certain black spot upon a watery green; the back is blackish from a blew, the belly is yellowish, it proceeds from an Aurelia coloured with gold.

2. The second is not so pleasing a colour, the inward wings from a fading blew, decline to a Crane colour, and end as it were into a lead-colour, the outward wings are blacker, noted here and there with dark spots, and the body seems to be the same, it flies rudely with dentless wings, and retrched in the borders, and as it were prickly, and like a mourner of that kind, it never comes forth but in mourning apparel.

3. We have painted this, as it were flifhe and raising it self with the wings lifted up, it hath also prickly dents, but the outward wing from a pale yellow is marked with the black pieces; but the next part of the inward wing from the root is dark black, the middle part is pale, the last part is whitish, chequered with right and thrawn fibres; the body appears dusky, the eye is black as pitch, the horns are black.

4. This is distinguished two waies; for when the opens either wing to balance her body, the body thewes black, and four dark wings fainted to it ridged as it were with a black pencil, and ending in a shining rufky colour; but when it fits on flowers and lifts up the wings, the first wing is yellowish, adorned with a comely round spot, like a target, the colour whereof is pale, the body of it black, the outward circle citron coloured; the belly, and breast, and the whole face are white; the black horns incline toward a yellow.

5. It seems inside and outside all alike; the head and wings look pale; the body is wan, as also the horns; the eyes are flaming red, the shoulders are hairy with a pale down.

When it stretcheth its wings towards you, it appears a shining sandy colour, like herb dragon, with black spots; the body also if you see the back, seems a warly black, the belly somewhat more dark; they eye is black, clear with a white, or whitish apple; the horns are black as a crow the wings from you are of an unpleasant brown, and of a decayed Weevil colour.

6. The
7. The jagged wings represent a fire-flone, shining with brili coloured little veins, and the skirt also being sprinkled with black spots; the whole body is of a shining black but that white points divide the horns, and in the black forehead golden eyes twinkle after a sort.

8. This hath the same kind of body, but the horns are reddish from yellow, the wings appear changeable, marked with divers pleats, ridges, borders, skirts, of many colours; all these colours are fad and dull to the eye; they want all clearness and varnish; and are plefiant only in their mixture, flying, and number; in some places they represent a smoky flame, elsewhere an unpleasing dark colour, and a fading red; and the rubies included in the left border in white semicircles are nothing lively.

9. The outward wings are spotted with dirty muddy spots, about the last part they are adorned with a black target, the middle whereof is set forth with an ivory point; the inward wings have four such targets, but augmented with a yellow circle besides; the two middlemost are of a fit magnitude, the two outermost are very small; the body of this creature is a whitish dark; the eyes that stick out are black: but if you look upon the inward part of the innermost wings, they look smoky, and they are very beautifull, with six gilded leaves curiously disposed.

10. The head is a pure white, but some dusky and black spots adorn the milky wings, the back and sides are red from yellow; or black spots put under the cuts do adorn them.

11. In proportion, and almost in colour and form of the body it represents the Eagle amongst birds of prey. It hath narrower wings than other Butterflies; it hath as it were a broad feathery tail; the inward wings are not watry coloured like the ruff of the body, but red from yellow, or of a flame colour; it hath a crooked nose like the Eagle, a belly hoary, the horns are great and frowns of the same colour with the uppermost wings; the eyes are pretty well prominent, black, with a pupil white as snow.

12. This hath the same form; it only differs in colour. The body is ash-colour, the tail is black, and the back is something silver coloured; the wings are long and blackish, and polluted with little black spots; the inward wings appear dusky dark-coloured; both their kinds of Butterflies are wonderful swift, and dare for flight to contend with the Eagle.

13. This
12. This is the swiftest of all, and hath shoulders seeming of a yellow moss's colour; the wings are white as milk; in the extremities of them they are marked with five or six dusky feathers, the middle of the yellowish back is adorned with a color black spot, of both sides two downy exuberances are thrust forth, the ramp is compassed about with a certain black down, it will fly as fast as any Swallow, and indeed is swifter than any Bird.

We have seen but eight of the smaller kinde.

1. The first parts of the inner wings are of a full bright fire; the smaller scarlet colour, and delicate red, but the outward wings for Dayrepresent a light purple, mingled of black and red, and drawn butterflies, over with some snow white spots; the rest of the body is black, even the branched horns also.

2. This is silver colour at the roots of the wings; which afterwards are purple coloured from blue; the uppermost wings are graced inwardly with two black white flutes; the body is full of dusky spots; it hath six purple feet, three put forth on each side; it hath a crooked bill; out of the head four small horns break forth, besides the two long ones.

3. If you should see this fly, you would say that the wings are of a decayed purple colour, pathug to a lively blue, and all plighted severally, but inwardly there are round eyes, they seem more gray and cankered; the head is blue from green, the body is deckt with dusky and white laces; the eyes seem very black, and the apples of them very white.

4. It comes in a pleasant habit, with wings set with eyes, that are of a moit heavenly incomparable blew. The most perfect artificer Nature it self made it all eyes; that you would say directly, that Argus eyes were not set into the Peacocks tail, but into the wings of this Butterfly, which doth stretch out against the Sun with no leffe pride than the Peacock doth, and (by the heavenly colour which she excels in) she is almost able to shame the Peacock.

5. The body is of a Crane colour, the upper wings are green in a white stalk; in the middle they are yellow and ash-colour, the inferior wings are at the root of a dark green, otherwise whole, but inwardly they are sprinkled often with spots of an unpleasante green; the eyes are black, as are the heads of their horns.

6. It hath round bunched smooth shoulders, which are of the colour of ashes mingled with ink, the body is full of cuts, and is of an ash kinde of colour; it hath narrow wings, and the utmost are of a Crane colour shining with some exceeding blood red drops, the little head, the feet, the horns are like the body in colour.

O 0 0 0

7. You
7. You would say, that this is kin to that is bred of Ginny pepper, and setting aside that it is fullest and more black in body, and the silver colour of his upper wings, it hardly differs from that.

8. All the wings are faint clay colour, or rather shining with a pale yellow, with some brown spots, and others that represent old cankered colours, the little eyes are black as a raven, otherwise it is all yellow.

9. All the wings are painted white and gray like sea shell-filis, the borders are rounded, and decked with white lines running through the middle with indentures.

10. This hath wings like Perwinkle shells, set with studs, it is mingled colour of a white and obfuscetered, and doth set forth to us the unpeakable power of God in the diversity of its colours.

Of the use of Butterflies.

He that beholds the forms, clothing, elegance, and rich habits of the Butterflies, how he chooses but admire the bountiful God, who is the Author and giver of so rich treasure? wherefore art thou proud in decked thy selfs, and taketh too much delight in thy own beauty? poolest thy temporary fading goods without envy, for know that there is no Butterly but is as beautiful and pleasing, and for the length of their life they have a more constant comeliness than thou hast: thou hast it may be an incredible agility of body, and numberless in running, but yet Or man if thou shouldst exceed all men, thou canst not equal a Butterly. But you will reply that thy clothed is incomparable, and that you can boast of the Perlum and Tyrian silk, of the best purple dyes, brought unto you by shipping: truly should you but see the rich robes of any Butterfly, besides their purple dyes, and the rows of pearls, and the borders set with diamonds, rubies, the pyropus, opals, emods; if you did but see and consider seriously the elaborate composition of their future and joyous and the embroidered work here and there, of fine divers coloured twine silk set with studs and eyes of gold and silver, thou wouldst let fall thy painted tail like the Peacock, and calling thy eyes down to the ground from whence thou wert made, thou wouldst learn to be more wise. It may be thou wert born at first in a house of clay and mud walls, or else in a palace built of polished stones; but some Butterflies are born in their houses that are the Aurelia like to pure gold, and exceed Attalus for the excellency of their birth, and delicacy of their apparel. Learn therefore O mortal Man, who ever thou art, that God that is best and greatest of all, made the butterfly to pull down thy pride, and by the shortness of their life (which is of no great continuance) be thou mindful of thy own falling condition. Wert thou as strong as Milo or Hercules and were fenced or guarded about with an host of Giants for force and valour; remember that rich an Army was put to the worst by an army of Butterflies flying in Troops in the air, in the year 104, and they hid the light of the Sun like a cloud. Lycophanes relates, that on the third day of August, 1543, that no hearb was left by reason of their multitudes, and they had devoured all the sweet dew and natural moisture, and they had burn'd up the very grave that was confused with their dry dung... Also in the year 1553, as Schedanus reports, a little before the death of Maurissius, the
Of lesser living Creatures.

The Greeks have many names for this Insect, for from the shining of the flanks and tail, it is called Καπνίς, μετακραίμει, κομμέλα. Suidas calleth it πλαθάνιος. Aristophanes, Hesychius,νονεραίας: it is also by way of metaphor perhaps called from the Latin word Schistula, a spark, καπνίζω, &c. &c. The same Author calleth the male of it ocularia, because it is καπνεται, but the female cannot be so called: some improperly call it φαλένα, for it is one thing to cover the light, another to carry light with it. Tho' which Aristophanes calls ὁδοθί, some improperly Cicindelae or Glow-worms; but upon what ground let them judge.

The Latinos call it Cicindela, Nettica, Nettula, Lucius, Luculce, Lucida, Flaminus, Vener, Lucernitus, Incendula, as appears out of Cicero, Pliny, Scalpo, Agricola, Verres, Felinus, Planeta Scalius, Turainus Albertius, and Sylvacia. In Arabick they are called Allahachtis; that is to say, bit by flying by night: in French Fortifant, Monch clair: of the Germans some call it Zindurcle, others Licht mucki, i.e. a shining fly, and Zindurnkre, speaking of the male. For in some places of Germany this male Glow-worm, that is which flies, doth not shine at all, but only the female called Grafs worm, Gingle, and Froenecz. About France the main from the time in which they do most frequently appear they are called St. Johannis Käferl and St. Joannes Fliegen. In Brabant Ein licht of nacht muggel. In Italian Lucilius, Lucilia, Farfalla, although they grant this to be the name of other sorts of flies that come about the candles, in Venice, Biefella (lucela), i.e. a fiery worm: in Cremona, Lucerola, Lombardy, Lucerola, in Spain, Lucerina and Lucerina; in Poland, Zkronek, Character, Wurny, Semicolor, in Hungary, Eyk wandrkh, boderakos.
The Theater of Insects: or, Book I.

Their description.

viLAMt. In English, Glow-worm, Shine-worm, Glis-worm; i.e. a glinting or shining worm. For here, as also in Galenicus the male or flying Glow-worm flies not, but the females which are meet worms. On the other side in Italy, and in the Country of Heidelberg, the females shine not at all, and the males do. I leave the reason to be discussed by Philosophers.

Now the male Glow-worms have wings, the female are without, and that is in Europe it self. The male Glow-worm of Europe, is a little creature flying, having four wings the outmost whereof are like leather, the innermost membranous of a silver colour, transparent. The body is long, a little squat and flat, having five incisures or clits: whereby it may be extended or contracted as occasion serves; the body at length seems to be longer than the wings, when contracted, shorter; the head broad, dummis, flat like a hood; out of the forehead come two incisures as out of one centre, near which the forepart of the head hath a little exsturbate: not far off from the roots of the incisures on each side rise little round swellings, shining like jet, which are in head of eyes, the head joined to a very short neck and body, of a blackish dun colour, it hath six feet in the breast near unto the head, the hinder of which together with the thumbs are of a yellowish colour, the rest of the feet blackish, it is slow, and creeps as it were with a grave pace; the breast buncheth forth a little, the body between the incisures or clits whith, at the tail it hath two spots, on each side one like a Moon, in clearing out of which cometh that shining brightness in the night, like burning brimstone, as if it did sparkle in the air: this never is seen in England, or if it do live here, it shines not at all.

The female Glow-worm is a slow paced creature without wings, the breadth of two fingers in length (although in Galenicus Joseph Scaliger (a great Philosopher of our times, not behinde any of the Ancients) hath diversely observed; whole words are these: Cicindelam volantim in coitu reprehendi &c. I enlightened (faith he) the Cicindela or Glow-worm flying with her male in the act of copulation; the male being toucht did not refrain; they were put into a box with boles in it all night, the next day the male stuck close; at noon the male let go and died. After which time about the evening many eggs were laid by the females which within the space of twenty hours went away alive. This story William Brewer in Englishman, a learned man and my good friend affirms for truth, being an eye-witness thereof, seeing them once in the act of generation. They are long in the act, and to bring forth many insects, this the Philosopher confirms speaking of insects thus in his 1. Book de gen. cap. ult. sapiens (Ap. mth. xiv. Sim. taries long in copulation, but afterwirds brings forth facility: I could with Scaliger had took notice what creatures came from those eggs for to the story had been more particular. Though yet according to the course of nature it be easy to judge. For what could come out of them, but those small Ereces black, thick, and rough, of which Aristotle, l. 19. faith those Glow-worms without wings are generated. Of these then came the unwinged Glow-worms, and of them with some alteration the flying Glow-worms called Bofrichi. From whence it is to be noted, that either Aritistakes copy is faulty, or that the interpreters have committed two errors; they have altogether left out the word μακρος (which makes so much for the clearing of the story. Secondly, out of those being changed they say come those (which Gesta translated) Cirrus, altogether against the mind of the Philosopher, if the Greek copy be not corrupted. For so runs the Greek, Ex λαίας φοινος & Sac. Or out of certain black, rough small worms cometh the Cicindela without wings; out of which in the second place being altered into a Chrysela cometh the flying Glow-worm; and out of them in the third place those which are called Bofrichi. But what insects
In the order of the Greeks, to which they are often called, are the Glow-worms, which are three kinds: the first, the bright-winged; the second, the little-winged; and the third, the wingless. The first kind, with its wings, is found in Europe, Asia, and Africa; the second, with its little wings, is found in Asia and Africa; and the third, wingless, is found in Europe, Asia, and Africa.

The Glow-worms are found in Europe, Asia, and Africa. Amongst the Glow-worms, which are found in Europe, are the following: the first, the bright-winged; the second, the little-winged; and the third, the wingless. The first kind, with its wings, is found in Europe, Asia, and Africa; the second, with its little wings, is found in Asia and Africa; and the third, wingless, is found in Europe, Asia, and Africa.

The Glow-worms are found in Europe, Asia, and Africa. Amongst the Glow-worms, which are found in Europe, are the following: the first, the bright-winged; the second, the little-winged; and the third, the wingless. The first kind, with its wings, is found in Europe, Asia, and Africa; the second, with its little wings, is found in Asia and Africa; and the third, wingless, is found in Europe, Asia, and Africa.
made use of no other light, neither within nor without their houses. But the Spaniards (because they had little light with their lives) did use within doors about their bmuse lamps and candles. But if they were to march forth against an enemy newly arrived, they make use of them to confound them, and each finder carrying four of them about him, divers ways confound the enemy. For when a naked traveller (as T. Cargo do in the Indies, and that very night that they came thither, lay hard by in the woods an infinite number of moving candles and torches as it were beyond their expectation, they thinking the Spaniards were come upon them unawares with guns and pistols and much light, speedily be- took them to their flaps. Many other insects of this kind are there to be found. But because this seemeth to be of most account, and to have the prehension above the rest, Ovidius hath left the rest undescribed. The Indians use to rub their faces with a paste made of them that so their bodies may seem all of a flame. How this may be, since as said before, the light variegeth with the life, I do not see, unless it be that the light may endure a while after they are dead, but that long it cannot remain is manifest by experience.

The Indians finding so great need of them, in that they could not rest in the night for the Gnats stinging them (which the Glow-worms being kept in the house did as greedily hunt after as Swallowes do Flies) and because they could not work by night without this luminous nature, before such time as the Spaniards came thither; they be thought of by some men whereby to catch them; the which I shall very partly out of Peter Martyr, partly from those reports of others which were eyewitnesses of the same.

Whereas the Indians were constrained by reason of want of light to lie all the night idle, they got them out of doors with a lighted firebrand and crying aloud Cicadae, cicadae; they do so beat the air, that either for love of the light they fly to them, or for fear of the cold they fall to the ground; which come with leaves of trees, others with linens rags, others with little nets made for the purpose detain till they can come to take them with their hands.

There are other little flying beasts, whose shine by night, but a great deal bigger than ours, and sending forth a far greater light. For they shine so bright that those which take long journeys make them take by a way to their heads and feet being alive; for so they may be seen afar off to the astonishment of those that know not the matter: the women use no other light to do their busines withal by night within doors but this.

There are yet other worms of another form, which give light by night; as we read in the Commentaries of Navigation. In the Island called Hispaniola, there are two sorts of worms which
flame by night. Some of the length of a mans little fingers bender, with many feet, glistening to bright in the dark, that a man may see all round about him for fifty or an hundred paces easily. That clear light flames forth only out of the cliffs, or if you will the junctures of the body near the feet. There are others like to these in bignes, and altogether as lightomes but only that their lightes ilueth from the head. Those things were noted in the histories of Navigation. But whether these Citiiades be of the kind of the Julii (as I think them to be). or whether they be like to our Isis not declared. But I neglece them to be by the multitude of the feet they have; for the Author reckons them in the number of the Scolopenes: Velarini Curtas in Diocles, makes mention of the Scolopenes (as he interprete it) whereas it is indeed a kindes of the Julii which in moit places, and in rainy weather shine very bright. Such a one my friend Brewer found in England in the heath grounds, and sent the worm dryed to Pembury. But that every man may better understand it, I shall set down his own words: Twice found a Scolopenes that shines in the night (yet as I said they are kindes of Julii) in summer nights, of a shining fiery appearance, in heavith and mois grounds. The whole body Shines together somewhat more darkly than a glow-worm. He further adds, It once hapned that I came sweating home to my house at night; that I wiped my head in the dark with a napkin, the napkin seemed to me all over of a flaming fire; whereupon I wondere a while; at this I saw miracles, all the little seemed to draw to one place, then folding the napkin together, I called for a candle, and opening the cloth, I found such a Scolopenes which I had rubbed against my head, and had caused this strange light like fire: Thus far Brewers who affirms that it was like to the Scolopenes commonly so called in gardens, and under stones and earthen vessels, wherein women are wont to set their choice plants or slips. All the Summer time and Autumn (faith Gadantius Merula lib. 3. memor. c. 61.) in griaffe ditches and without water when I was at Leheium (which is now called Farnierfor) I gathered little shining hairy worms in the night. The tame I saw in the ditches about Vigelewm (which of old was called Vergelemum) as Simon Eutens and I were walking abroad in the evening to take the air. But what those hairy worms should be, unless they be a kindes of Julii I do not know. There is another worm altogether unlike thefe of which we read in the book of the Nature of things: There is (faith he) a worm like a tay, which Shines like a fire in the dark, it is never seen but in great rains and then it foreteels fair weather to come shortly after. So great is the coldness of this worm, that it will put like ice out the fire.

If a mans flesh be but touched with the flame of this worm, all his hair will come off; and whatsoever it toucheth there with changeth the colour of it into green. But all these he handleth unhurtfully; for he confounds the Scolii (which he here calls Scolia) with the Salamander and Cicindelis and of these he makeith a very confuted and imperfect history. Neither doth Guilerimin de Combins nor Vincentius (which transferred all almost out of Guillerimin) in his obscure and dark tract where he reports this story, corret it. But these things are nothing to the Cicindelis and that which they write concernung the Salamander is other where amended. Hitherto of Insects shining in the dark.

Whether or no the Glow-worm being dead doth retain its splendor and shining, is wonte to be a question. Maufatius a very learned man writing on Pliny his 9. Book, faith it doth, and that boys taking the Glow-worms used to put about their heads the shining parts of them; with which if the hands or other parts of the body be rubbed, they also will shine in the dark. But by the leave of so great and learned a man as he is, experience teacheath the contrary. For after the Glow-worm is dead, that part whereof which so shinet in the night, though not proprly, yet within a few hours after is quite lost; and seemeth altogether to go away with the vital spirits; this is a clear case, from experience, and I have often tried the same. This I will grant: it is certain number of those that have no wings (for those that have shine not but only when the fly) be but put into a clear Crystal glasse, so that the air may freely come at them, with a little glass they may perchance give light for the space of some 12, 13, every day fresh glass be put to them; but at the length as they languish and faint away, so the light by little and little is remitted and slackned, and in the end they dying (as before is said) it is totally extinguished.

Vainly therefore do some boast of compositions made of them, with which they will keep perpetual light, as they suppose (amongst whom is Cardanus) as if they would bring down the Moon from heaven. Others there are not learned only but unlearned also, who have commited these compositions to writings, whereby they might the better betray their own ignorance. Of this perpetual light Albertius makes mention who in his Works gathers a whole bundle of lies together as it were into one body. And here now I will set down some of them that the Reader may be aware of them and the vanity and levity of the writers themselves may be manifeste. Some there are which take a great many Glow-worms, beat them together, put them into a vial of glasse and bury them fifteen dayes in horce dung. Afterwards they distil them through an Alumbick, and keep the water in a clear glasse. To this end Gadantius Merula, who hath heapep up many things together from this and that Author, without any judgement, hath these words: Of these Glow-worms being perfected, there is made a water, or a liquor rather, to a vessel which will wonderfully shine in the dark. Such a light doth this water or liquor give, by reports that in the dark at any one may read and write; and do any other busines as he pleaseth. Others left they should seem not to add to what is invented to their hands (for pregnant wits unless they bring forth some novelty are not well) together with the Glow-worms exhibit the fall of the Torosio, of
of a Wesphol and Sar-dogs, putting them in dung and afterwards they distill them. This watereth
tfay far exceed all other whatsoever in harte. Others put whole Glow-worms in dung for nine
days to digest; others for three weeks, then throwing away the Glow-worms, they take the fat
of them and keep it in a clean glass for use. Some yet more fondly take Glow-worms, and
casting away their heads, they put to them the scales of fishes, and rotten shining wood, such as
flitens in the dark, with the gas of Sar-dogs, and so distill them through an Alambick. Others
promise confidently to make letters to shine in the dark, by pricking out the yellow moiture of
the Glow-worm, and anointing therewith the paper, or painting it with the fame liquor in form
of a star, some rub them with the oyl of Limced upon marbles, and whatsoever you shall paint or
write, they persuade us, may easily read in the night, be it never to dark; but let them believe
that there have made the trial. Others after they have digested in horte-dung nine days, take
the liquor that is left in the bottome of the glasses and write with it, and so think confidently to
obtain their desire. John Arden, a skilfull Chirurgeon, an English man, walking after his steps,
above thirty years ago left such a description of this perpertual light in writing:—He gathereth
a great number of Glow-worms, and flush them in a gullen vessel well fopt, laces them in dung
fifteen days, then puts the water he findes in the bottome of the glases into a clear glafs; to
which he adds as much of Quicksilver, the drofs being purged from it, and then he faith you must
shut the glafs mouth very close, and hang it where you will, and then for certen (as he affirns)
it will produce the wifhed effect. Some have told me that this is very true, whom notwithstanding
I will not believe until such time as the experiment be made before mine eyes. Thefe
and many the like you may finde by readings but what credit may be given to them is easily con-
jectured out of what went before. Hence then we may plainly understand how foolishly and
vainly mens wildeome doth many times vaunt it self, and whither our wits may be carried, if not
founded upon right Reason, the militres of all Arts and Sciences, flumminger with all diligence the
smooth rocks of opinion and fell conceit.

How wonderfully the works of God are in our eyes, none can be ignorant, who shall diligently
consider this little creature and weigh its nature, and its light relembling that divine light. For
who is he that beholde the vanishing light of this, that doth not fix the eyes of his minde upon
Chrit the faling true, and the chiefe light of the world; and doth not call to remembrance,
that holy Spirit which doth illuminate our spirits in the most obscure darkenes of our understand-
ings? But this inbred light of the Glow-worm or rather borrowed light which some feeke to
extract others strive to imitate (as for example Albertus, Cardus, Merula, Vitalis, Micaldus)
have shewed themselves very fools in my judgement. Neither have they been warred by the fatal
end of Salmonus or Aldinus, who going about to imitate Jupiter thunder and lightning, were
therewith by him struck dead, and so did reap a just reward of that their impious pretention, for
they felt the force of true heavenly fire, who thought to counterfeit the like with a vain crack-
ing. Even so the wits of these times, while they seek to extract this light, by their bold enter-
prize do violate the Deity, and while they would seem to adore and for the glory of that his
work, they rather detred from it and difgrace it. But we leave these to pursues wheels, and pro-
ceed rather piously, and modestly to behold the majesty, wildeome, and divine light in this little creature.
For he which shall go about fully to search the majesty of the Creature in these small
creatures shall soon be confounded with the glory of it.

What necessary use the Americans made of them in their night journeys and busines, before
the Spaniards brought in the use of Lamps and To. ches, hath been said already.

But we that live in Europe, as we travelled by night (I remembre:) in Italy and other places, we
took a great deal of delight in them, not so much because they distilled the darkenes with the
beams of their splendor, but because they did illustrate the earth with their celestial light, which
compared with the light of the Sun and Moon, were not to be despifed.

Neither do they only please the eye, and inflit the minde, but they are good for the body in
diverse diseases, for the female Cicindel being put into the matrix of the male, caufeth the wom-
man that bears childe with much danger to be barren; faith Kirandus. Cicindelis being drunk in
wine make the use of luft not only irkifome but loathfome, as Benedictus faith; the fame also
Gibertius an English Physician Albertus, Nicolaus, Florentinus, and Rhoffis do confidently affirm.
It was worthy wifheth therefore that that unclean force of Lerches we with the frequent tak-
ing of these in Potions disabled, who spare neither wife, widow no: maid, but defile themselves
with lust not fit to be mentioned. Rhoffis faith that the Glow-worms are very good for the
stones, if be there with oil, and therewith their place having the hair clipf off, he anonished, which
will never suffer it to grow afterwards, Bairus. If they be beaten and put behinde the ears, they
will divert and evacuate all rhumes falling into the eyes and teeth. Anonymus. The Inr births of
the Ille Serida take a good sufficient quantity of them, and mixing them with fresh black wax
make them into a mafs, and lay it in the hot lands till it be half consumed away: of this
mafs of the bignes of a walnut, both young and old do take two hours before noon and
hours after; which do not only infuce heat into the obscene parts, but vigour also.
Theven. But this is not to be understande of the ordinary Cicindelis which is afo called caufeth
vility and barrenenes; by these Thevetus men thoe Glow-worms reckned amongst the kindes of
Juler, which being taken in drink do after the same man-
ner with the Cantharides as Merula writhe, provoke both seed and urine, Aetias very highly cont-
commends them for excellent baits to fish withal, being fastened to the hook, 

The Locust is called of the Arabian, Gines; Gierad, Gerard; of the Illyrian, Kobilos, Bruck; of the Scholomonic, Konos; of the French, Saperelle, Saperon, Languste; of the Spaniard, Lagunia, Gofanbote, Gaphantoles; of the Italian, Cavalere, Scipion, Satello; of the German, Huenelick, Springelken, Springell; of the Dutch, Hupperluk; of the English, Grasshopper; from leaping upon the grass; of the Latin, Locustus, as some think a locis usit; for that they scourch all places where they touch, and eat up and devour all things; of the Hebrew, Arbeh; of the Polonian, Komik; Szaravess; of the Hungarian, Lasza; of the Greek, Ἀρβή. Æneas, Ἀρβή ἀνά τής δεξιότητάς τους, whence comes the diminutive Ædixus, Locustula, vel Locustella, a little Locust. The Ionians call them from the number of their wings Terraplenides; that is to say, four winged creatures; others call them Cornrop, Parnopus, and Panaepus; from whence Hesicles and Apollo were called of the Athenians Parnopius, because they drive the Locusts out of their country, as Pausanias, Herodotus, Calix Rhodogistus, Lilio, Giraldus, Camezius, Strabo, have observed. Norwithstanding the word panaepus (if the interpreter of Aristophanes deceives us not) signifies that of Locust only which is easy to be handled with the hands. But before we enter into the description and division of them into their several kindes, I cannot but admire with Marcellus Virgininus, the workeanship of Nature, in which I know not, as I may fo say whether the did more fearfully sport her selfe, or more sportingly labour. For who first of all is able to describe so many colours in one body? who is able to set forth to many divers shapes of bodies, going, leaping, flying. For some there are green, some black, some blue, some one part of them of this colour, on the other of another. There are those which are of another colour in their flight, then they seemed to be before. There are some fly with one pair of wings, others with more; those that have no wings they leap, those that cannot either fly or leap, they walk; some have longer flanks, some shorter, and amongst these some have more and shorter joynets, some fewer and longer, some there are that finge, others are silent, as the Strizhus: some do no harm at all to tillages, so that children may take them up in their hands without hurt; others on the contrary are the pest and destruction of all that up growes through a whole Country.

And as there are many kindes of them in nature, so their names were almost infinite, which through the neglect of Naturalists are grown out of life. 

Now all Locusts are either winged or without wings. Of the winged, some are more common and ordinary, some more rare; of the common sort, we have seen six kindes all green, and the letier of many colours. 

The fift of the biggest, hath as it were a grafs cowe or hood which covers the head, neck, and almost half the body; the wings come from the neck underneath, of a greenifh colour, speckled with a few small black spots, the back green, the belly daky coloured, the tail or fem of the end black; it hath a great mouth, and strong big teeth, excellently made to devour the fruits withall. The second seems to be like this, but that the hood is fastned to the neck; the nose also and mouth are more red, and it hath greater spots in the wings. The third is of a green countenance, the shanks whitish, the tail blackish, the wings beft with greater flore of spots, and about the edges of a pale red.
The Theater of Insects: or, Book I.

Now these are females, from whom the three males differ in this, that either in the end or above the tail they have two or three prickles or flings, and the middle of their hood appeareth more red.

The first sort of the lesser Locusts, called of the Tigrinae Holfspeckts, is in body black, the utmost wings spotted, the innermost spotted with vivianion; the thighs brown or swarthy, with black lines curiously drawn up and down. Of the second the cornicles, eyes, and flanks are of a plesiant red, the thighs or flanks are also diversifieid with black lines, the wings speckled, the belly of a dark red upon yellow, all which do exhibit a very fine pretty creature. The third seems to be of a dark blue-colour, the cornicles very short, and the wings of an unusual length, longer then the body. The fourth is all over of a darkish green, but that the head is set with two black lines, and the ends of the flanks are of a lively shining red. The fifth is a little lesser than the rest, but in ordering and variety of colour, more plesiant to the sight; the body, head, and feet are of a faint red, with green wings, and a golden lace drawn through the middle of the head very bright and shining.

All these of the lesser sort have wings as long or longer than their bodies; they have besides no stig or prickle in their tail, nor bear any stem; they are seldom seen in the corn but altogether in meddowes and pastures, as I have seen them in France, and our Country of Britannie: I have seen only three kindes very rare; i.e. Italian, Greek, and African: they are called Maurer foretellers; either because by their coming (for they first of all appear) they do shew the spring to be at hand, to Annex the Poet sang; or else they foretell dearth and famine, as Celius the Scholiast of Theocritus have observed. Or lastly, because it alwaies holds its paws in effect like hands praying as it were, after the manner of their Diviners, who in that gesture did pour out their applications to their
CHAP. 16. Of lesser living Creatures.

So divine a creature is this esteemed, that if a childe ask the way to such a place, she will stretch out one of her feet, and shew him the right way, and feldome or never misle. Her tail is two forked, armed with two briftly prickles: and as she resembles thofe Diviners in the elevation of her hands, fo alfo in likenefs of motion; for they do nor fport themselves as others do, nor leap, nor play; but walking fomy, she retains her modesty, and fhewes forth a kinde of motion and gravity.

Another fpieces of this Mantis, Carolus Clusius lent from Vienna exactly described, being brought thither out of Greece, which is like unto the former in shape and magnitude, but of another colour beloweon it either by nature or the place where it lives; for it hath cornicles of a full yellow, the eye of hyacinth colour, the wings of a faint yellow, the rump of the body of Amethyst, only that the feet fhanks, as alfo the joynts of them were more hairy and white, and the claws of the fingers curved backward were black.

I procured one from Barbary that was brought out of Africk with some cost to us, flider, five inches long, hooded; the head pyramidal, very long, out of which almost at the top came forth two little broad cornicles about an inch long, much like that Turbant, which the Tur-

kis Janizaries ufe with two feathers in it: a little below the root of it come forth two eyes standing out great, and of a dark red, the body long, of a blood red purple; the tail like a Swallow two forked, four wings of somewhat an all-colour, deckt with certain dunne spots; the four former feet and fhanks very fnder; the hinder (strong, brown) and long, and by reason of the spots drawn athwart all along the thighs blackish. And this of the common or ordinary and winged Locuits, and of the rarer sorts shall suffice to have been faid: unlefs the Reader fhall think fit with me to add more differences of them. The face of the ordinary Locuits is fierce, long, wrinkled, fenced as it were with fleshes, which even cover the mouth: in the upper part they have teeth furnished that are broad, black, and very hard, with which they fcarily eat ears of corn, and fhrench them with a great noise. The Greek and African Locuits appear with a short
The Theater of Insects: or, Book I.

Concerning the copulation of Locusts, I rather subscribe to Valerio (who hath search'd diligently into their nature) than to Aristotles himself. They couple at once (as I have seen) by the male getting upon the females, at what time he presseth those two prickles that come out of the end of his back into the matrix of the females, and so they continue in conjunction very close and for a long time; in so much they can scarce with your hands be pulled a-sunder when once coupled neither by leaping and motion or any other way. The female being tickled underneath, moveth her womb very busily, and applyeth herself with the bottom thereof to the male's dust held him for a long while, sometime with the opening of the matrix, sometimes with the flattening or closing of it again: augmenting the pleasure of her fancy; for while the matrix is open the male gets into the bottom or farther end thereof; and when it is contracted or closed, she is delighted with the affection and tickling of the womb and the palpi thereof. Now there are to be seen two palpiages in the secret part of the female separated by a kind of partition, and are covered over with a little thick cover, which in the outside is black, hard, and grizzly, but within somewhat roughish, hairy and wrinkled; at the bottom of this the matrix appears white like that of Women.

Now the female bringeth forth (as Aristotles faith) the little flie that grows to her tail, being stuck in the ground, and then layeth all her burden together in the same place, not scattering up and down, but as we like a white comb. Hence proceeds a kind of little worm in the likeness of an egg, included in a little earthy thin membrane, the which being forced outcometh the Locusts and fly abroad. But (by the favour of so great a Philosopher) they lay eggs indeed in the beginning of Autumn, though not of the fashion of eggs, as I have seen with my eyes, and have had them in my hands. The which figure is fo tender, that with the least touch it is bruited to pieces. Neither is it laid upon the superficies of the earth, but somewhat deeper, and in the winter under ground: where in the winter they be perfected by concretion, in the subsequent year, almost at the latter end of Spring they come forth out of the shell or membrane aforefaid, wherein they were, being little blackish Locusts creeping up and down without either shanks or wings, which afterwards in a short time become bigger. They bring forth at the latter end of Summer, and when they have so done they withthold not, certain little vertine breeding about their necks (as it happeneth to the Beetle) in the time of their bearing, which do strangle them. These dying after such a foolish fashion as they do, are yet able at their pleasance, any one of them, if it do but fasten on his chaps, to kill a Serpent. In a wet Spring the eggs perish, but in a dry there is a great increase of them. Some will have them to be brought forth and to dye twice a year, (in the number of whom is Willichius) that is to say, at the rising of the Pleiades they come forth, and dye at the setting of the Dog-star then others to be brought forth. Some say at the setting of Arcturus. In mountainous places, and of a thin air there breed no Locusts, but in plains and places full of clifts and chaps; nor do they lay their eggs upon the superficies, but in the cists and caverns of the earth, both that they may be the better concocted, as also better preserved from cold and rain.

That they should be generated of the carcasse of a Mule or Afe (as Plutarch reports in the life of Cleomedon) by putrefaction, I cannot with Philosophers determine; first, because it was permitted to the Jewish to feed on them: secondly, because no man ever yet was an eyewitness of such a putrid and ignoble generation of Locusts.

Their death. They dye several ways. For the male after copulation (wherein he carries very long, and as it is possible, till all his radical moity, and all his spirits at once are exhausted with his venery) presently expires. As in like manner all the females as soon as they have brought forth, whether with vehementy of pain, or numerous figures, I know not, the which being very great cannot chuse but spend and exhaust the strength thereof. Oftentimes also great swarms of them being lifted up into the air by the wind, which afterwards falling, they fall down into the seas, or standing lakes. They are reported to pass over to far remote shores, continuing their journey for many days together, they are to be seen very great, and also they make such noise with their wings, that you would think they were a flight of birds, and they darken the Sun.

Their Copulation and Generation.

Their Death.
Of lesser living Creatures.

They come oft-times out of Afric into Italy in great numbers, biting and gnawing all with their teeth, even the doors of their houses. Neither do they hurt the corn fields, pastures, meadows, The mischief gardens, orchards, with their biting only, but also with their black-burning frightening dung, and efppe they do, cially with their cholerick and butter some or spirithe, the which (as Valerius Warnell) they went in great abundance out of their mouths as they bite. Yet notwithstanding they are not venomous; the Parthians and certain of the Æthiopian live of them, esteeming them very dainty meat. They are laid in India to be three feet in length, their shanks and thighs when they are dry serving for faves to fly withall. That found or noife which they make, Arslgala faith is made with the ruffling of their wings. But according to Pliny, it seems to proceed from the hinder part of their head. But I suppose it is caused thre manner of waves, by the grating of their teeth. As they bite the herbs, with the clapping together of their wings as they flutter up and down with noife, with the rubbing of their hard neck and shoulders one against the other while they leap and themseſeſſe like fouldiers armed with helmet and breast plate, are used to do.

Now we are to speak of the Locusts which have no wings, and those especially are Bruchus, Attelabus, and Aesopus.

The Bruchus taking his name from biting and devouring, may be called a Locust without wings; as the tefl of the male, the female females. The Male hath a pale blue colour circle or collar about his neck, under which hangs a double hood of a light yellow, and green, more or less from the back to the tail it is fet out with fix feek coloured plates running across from the back to both sides. The belly, which is sufficiently great, with the three prickles of the tail, are of the colour of an herb newly preft out of the earth, of a yellowish green, as also the thighs, face and conicles; but the shanks seem reddith. The first of the females is all over eruginous, but for a bloud colour line running over the back from head to tail; it is without a prickle growing in the fem or tail; it seems alfo to be girt about with ten green places, or rounds. The fcond is almoſt all over of a light red and brown, the belly a little yello with, the upper end of the fem it hath two prickles. The third hath a head reſembling a hog`s or tca-calts head, in flead of cornicles it hath a little beard on each fide of the nose; the two bunches or swellings on the top of the forehead are like to the ears of a Bear, and it hath two prickles upon the fem very sharp and brown, of the famie colour with the reft of the body. Thofe did that famious knight Sir Edmund Knivet, freely fend in picture to Penmus for the enlargement of this work, for he is a Knight that is ve ry courteous to learned men, andingularly noble both by deſcend and vertue, and famous for his curious fearch into the knowledge of natural things. The Latins call them Bruchs; the Mołtovites Chragf; the Polomans, Knorick; the English, field Crickets. Attelabus, is a fmall Locust, faith Hufchius, Pliny thinks it one of the smallift kinde; Hierome on the 3. chaper of the prophet Book, calls the little off-spring of Locuits Attelabi; Aquila more significantly interpretes them devourers. A little Locuit is laid to be the mean between a Locuit and Bruchus; it hath fuch little wittes that it is reputed to have none, and feems rather to creep than fly: for this caufe wherever it is bred, it bringeth all as it were to meal or nut, by grinding and confuming. It feems to fome to be of the kinde of Bruchus, till the wings grow forth, and then it grows into the number of Locuits. Stephanus, between Attelabus from Attelabi, because the wings seem fo small as it had none. The Attelabi, as Ariffta faith, do breed in fallow fields, as Grapthoppers do; they bring forth, and when they have brought forth they dye as other Locuits do; their eggs are spoiled by wet Autumns, when the waters increase too much; but in a dry Autum, the Attelabi increase more, because their eggs escape drowning. Attelabus; or Òer`, as Dioscovides calls it, hath his name from its flow motion, it hath no wings, thick legs, but fhort withall, not like other Locuits, whence it feems rather to creep than leap; it hath a great belly hanging down, as if it were made to devor corn. This Locuit may be is called in Scripture αἰθής, Nicander calls it αιθης, and αἰθής; though, as Ciferinus faith, in the Diachon of the Ambraciat, all Locuits are called μωλον, because they eat corn with a noife of their teeth. Franciſc an incarnus writ a little Treat of seven kindes of Locuits, according to the Scriptures and Rabbinis; but he decribed not thoe four which are numbered amongst clean birds that the Jewes might lawfully eat; thoe four were Arbeith, Saliams, Chargels, and Chagabal, which the Chaldens call几何, Rhaschen, Chargalas, Chorgeha; and the Greeks call them αἰθής, ιδιάρ, and αἰθής. Arbeith is a kinde of Locuit, called fo from her fruitfulnes, as Kimbi, Munfer, and Bronghton observe. The Septuagint have tranlated Saliams, οἶνοα, Hierome doth not rightly.
call it Scareodenn; for it is a flying creature, creeping with four feet, and leaping with its two hinder feet longer than the former feet. Kimchi makes it a kind of Locust which the Rabbins call Rhabckinn; Abahuza thinks that to be called Salham that its amongst stones; and Himmi subscribes to this opinion the foresaid interpreters called Chorgal, Sophieous, for it fights with the serpents, and flopping the chaps thereof, it kills the Serpent: Aristotle Hift. 9, cap. 6. faith that many have seen the Locust called Deos, which when it fighteth with the Serpent taketh him by the neck. Niphon needed not interpret tath Sophieous to be the Scelopendra or Viper, since the Philosopher calls it duely Sophieous; and the 70, learned interpreters say it is a Locust; however it seems Niphon was so blinde that he thought it impossibl for so small a creature to kill a Serpents but we thought he safer to rely on the testimoniies of so many learned men, (who had an insight into Locusts, and almost into all natural things) than upon the conjectures of so frivolous a Commentator, and deviser of novelties. Hagob or Chagob is called Attelabus; Hersona calls it Attacen. Amongst the Locusts spoken of, this is reckoned to be the lafl, and is per, in the left place, as likely to be the most grievous; for this not only taints of corn or eateth it, but breaks and grinds talk and all. It is bred of egges in a land fruitful for corn, which the female left there when the corn was gone.

Five other kinds of Locusts are numbered up, Joel 1. Amos 4. Dent. 28. and Psal. 78. namely Gamar from shearing; Telaka from licking; Chazalis from destroying; Thelafals from the blusting and nuff it brings to corn; and Chenamah from biting; because where it sets up its station, it tarryth there, and fortakes it not. Rodolphus Madinis on Leviticos and the Prophet Joel reckon divers kinds of Bruchi; some are golden colour, others yellow, others gray; Also from a whitish worm in frothy dew that in Megsicks to plants, a certain winged green creature is bred, in form like to the smallest kind of Caterpillar, first it leaps, and afterwards it flies, and therefore I think fit to call it Loculence, a little Locust. The English call that frothy matter Wood-spar, as if you would say the purefaction of the wood. The Germans call it Czekken-spirle: but what form that was of which Strarius says Cesius, Prusius, Nicander, Pausanias, Heft- chius, Didera, Jegen, Mebas, Syma, Separab, Aristophanes, Probis, Enthusias, Wase, Pho- vornias, Chirpe, and Isadores Ludoboeus; truly I cannot tell and I would gladly see some Oedipus who would declare their nature and use. But because Marcillus affirmes that there are some Locusts that use but two wings; and Willichen affirms to some six wings; they should either have described them, or have held their peace in a matter that exceeds belief. Also he flipp very absurdly, when he assigned a King and a Monarchy to be amongst them. May be amongst many little ones, he found one great one, and fhalned him for their King, because he excelled in magnitude; but Solomon, (that was of Philofophers and wise men the chief) faith they have no King, but are subject to a Common-wealth as Piumares are.

How God by these very little creatures did punish the pride and haughtines, and hard heartedness of Pharaoh, is apparent enough out of Exodus, and is spoken of every where. In the year 170, before the birth of Chrift, all the meadow sand were covered with clouds of Locusts, and nuff hundred thousand, com it is said, to the country, Julius Obfequens. In the year after Christ, 181, the war long enduring in Illyricum France Italy, and at that time being ended, that nothing might be wanting to punish those Nations, an innumerable company of Locusts, and far greater than the ordinary ones, confumed all the graft round about. In the year of our Lord, 591. when Agilinus reigned in Lombardy, a very great plenty of Locusts afflicted the Countrey about Trent, which are reported to be brought ouf of Africa by force of the winds; but the greater part of them were cast down with storms and drowned; but they were no left hurtfull and deadly to the Italians; for by the waves they were brought to the shores of Cyprus and by their venomous flinking smell, they caufed such a plague amongst mortals, that Julius writes, that of men and cattle there died above 80,000. Alfo at Venice, and about Brefcia for want of corns (for the Locusts had confumed all) fcalentamental a plague followed that in the year 1748, when thefe things hapned, above 30,000, men died of it. Again in the years 593, 693, and 811. Locusts came flying out of Africa after a great drought, that devoured plants, herbs, and baaks of trees, whence followed a strange famine; and fuch as is elegantly defcribed by the Author of Nannachius, in thefe veres:---

The mischiefs of Locusts do--

Famine was present with her empty veins:
The poor with hunger starv'd, their breath
Was spent; for neither broth nor bread remains:
Upon their mouths and guts hunger laid hold; They melt the chaps and bite their teeth not meat; Through wrinkled skin their bones might be told:
Nothing but skin and bone, they'd sought to eat;
In stead of belly stood an empty place;
The breast hung down, and seemed for to fly:
On the back bones rough great, pale was the face;
Lips white, eyes sunk, teeth stark, all was like clay.

Nor
Not was France free from their teeth and devourings, but in the years since the time the Virgin brought forth her son, namely in the year 1455, 1377, 1353, 1374, was miserably waited, and the citizens consumed by famine, and very many killed by a plague that followed it, and sometimes it left a third part of the inhabitants. These Locusts had commonly six wings, and were brought thither from the East. But at length by force of winds they were carried into the British Sea and drowned there: but by the flowing of the sea they were cast to the shore, and infected the air, and caused a plague no less cruel than the famine that went before. "Otho Frugi- gens." Also in the year 1476, they waited almost all Polandia. In 1336, innumerable troops of Locusts were brought by winds from the Sea Euxinum into that part of Sarmatia which is called Podbassia, where they did change their camps in a military order, and they eat up all that was in the fields where they pitched both by day and night; these of an unusual greatness at first wanted wings; then their wings growing forth, they flew at pleasure; and what shall I say? they eat not only herbs and leaves, and flowers, but hardly left any bark on the trees. Then they wandered through Germany, and came as far as Mil- lan, and having destroyed all there they returned to Polonia and Sicilia. At last in November for so long they lived, when they were consumed by force of cold, they called such a flemch, that had they not been eaten up by hogs, and wild bores, they would have caused as great a plague, as they had done a famine in Germany and Italy. In the year 1543, Locusts did a very great mischief to the Countreys of Mijnia and Marchia; at which time they were so frequent in Locumin, that being in heaps they were above a cubit high. Jacobus Eusebius. In the year 1553, it is commonly known what great damage did military companies of Locusts did at Arles: whilst we were writing this, we received news that the Spaniards were sorely afflicted with swarms of Locusts brought thither out of Africa. For they fly not like Armies through the skies, and darken the air. And the people when they saw them, rang all their bells, shot their ordnance, founded with trumpets, tinkled with brazen vettles, call up land, did all they could to drive them away; but they could not obtain what they desired, wherefore fearing their labour in vain, they died every where of hunger and contagion: as the Mariners and steer-men reported to us, who escaped very hardly from that danger themselves. "Entropima lib. 4. makes mention of very great Locusts, which were seen not far from Rome; to the wonder and amazement of the beholders, the inhabitants were so afraid of them, for their devouring nature, that they were frightened at their sight: Hence we may collect that those creatures are not the smallest amongst the Armies of the Lord of boifs, when he pleareth to punish the sins of men, and to revenge himself on the defpiers of his Lawes. But as his Justice is admirable, so in his greatest severity Mercy is not wanting: for being that Locusts have brought sundry Nations to want and hunger, and they have had no thing to eat, these Locusts have died sudden, and became meat for the people afflicted before: the people of hot Countries, their Utile. (whom especially they spoil of their increase of fruits) as the Ehtiopians, Tagetens, Parthians, Arabian, Lybiens, Medeens, Zemenes, Darenienens, Africanes and those that live about Lepros, the Zanaughis, Sengenepes people of Mauritania, and others live chiefly upon Locusts, and account their egges to be delicious; others prepare them thus; first in a low large place they make a great smock, by which the Locusts in flying are hindered and forced to fall; than when they have taken them they dry them with salt, the Sun and smoke, and cutting them in pieces, they keep them for their yearly provision, as we do fishes, not only those which have large legs, but the Atelabis, the Aellis Africas, and almost all kinds of Locusts, as we collect out of Dioscorides Strabo, Pliny, Solinus, Agatharchis, Pultarchis, Avicenna, Ptolemus, Loc and Dionysius Africanus; Elban, Diosorus Siculus, Aloysis, Cadmus, Africole, and the Centuries of Navigations, whence they were called dessed intellectuals, Locust-eaters. Yet though they accounted them amongst their choice meats, yet the Greecians esteemed them but for meaner fare; if we believe Aristotle and Pultarch in Sympol. where he calls them the Sultainer of the Countrymans table; S. Matthew in the 3. chapters, faith that John, the Baptist lived upon them and wildy honey; and God appointed for leaven, for to be a comest among Locusts for food, let them read the most learned Annotations of Venerable Bede upon St. Matthew. They have no venom in them; yet they that feed on them are not long lived, and fields that live to 40. years, and frequently die young, as Diosorus Siculus, Agatharchis, and Strabo have observed. St. Ambrose faith that Locusts hurt neither men nor fruits by themselves, but nourish them; and feed not on fruits unless God command them. But when God gives the word, they kill men, spoil the ground, and execute the vengeance of God. Matt. as I said, travellers feed not upon fruits; Ophiosmachi kills Serpens, all Locusts foresaw the Spring, and what is more acceptable to us? and if to so great multitudes they forset all of famine, by that they secretly invite us to prayers and repentance; they live so lovingly together, that they stand in need of neither King nor Emperor; for they fly together as Solomon faith, Prov. 30. without a King and live in concord, whence is that saying of Ecclesiastes, Thy keepers are as Locusts, and thy children at the young Locusts: that is not only numerous, but unanimous, and conspiring together.

What concerns their use in Phyfick, the Locusts are serving to that end also: for their smell their use in cures the Strangury, especially of women. "Discord. Bread eat with the flesh of Locusts, is good Phyfick, for those who are troubled with the Stone; fried Locusts take away the roughness of the nails; Locust legs bruised with Goats tallow, cure the Leprosie. Pliny. Mantes cure hard scrofulous re-
mors: Aedili dried and drank with wine are excellent good against the stinging of the Scorpion.

Aedali, cure the stinging of Bees, Wasps, Hornets, and Huts by Blood-fingers. Diphed, Empir, and Pliny 29. 4. Aradus describes this composition for the white skins of the eye for dimness, and cloud. Brevisarius lib. 1. c. 16. Let the Locusts be not all either green nor wholly black, but in a string through them and Strange them in a little White-wine, then dry them in the shade, then take Primrose roots, and Fennel roots, dry and powder them, and mingle with the powder of the Locust, then keep the powder bound in a cloth, in the said White-wine in a brazen vessel; of which wine (the cloth being fast gently crusted) drop two or three drops into the eyes: As for their quality and temperament, until they heat a little; they inflame, increase feed, take up venery, when they are failed; it items they are of worst juice: they cause thirst and burn the blood; yet they hurt not droppe persons; nor such as are lencoplogemathan. Sisineu. Further to touch upon other uses of them; Locusts, their feet and wings taken away, are good to feed young Peacocks, Columbida. Frogs about lakes and many fish feed on Locusts, which is so well known, that Belo-

ninus whitteth the same. Also the Selenitas have a bird feeds on Locusts, as Heftichs remembers. Jackdaws do also devour them; wherefore at the publick charge they are maintained in Thesius, Privy, and Lemnos: for they not only destroy Locusts coming, but they also devour their flue, whereby corn is preferred unhurt. Also they are good for Roos, Coughs, Hens, Geese, Ducks, for Hog all and theep, as beside histories, and long experience, Plutarch witteth in his book of Jis and Ofirs. Lastly, if your credit may be given to Apomastins a man moit, learned in the learning of the Indians, Persians, and Egyptians, to dream of the coming of Locusts is a sight of an Army coming against us, and so much as they shall seem to hurt or not hurt us, so shall the enemy.

Now it will be time to shew by what means the great abundance of them may be driven away by the providence and wisdom of man, and so I shall conclude this Chapter. Pliny tells, that in the Country of Cyprus, it was ordered by a Law, that thrice in the year they should war against the Locusts. Firstly, breaking their eggs, then destroying young ones, then by killing the grown Locusts. If any failed of this duty they were punished for their default. The Mag-

niis and Ephesians much in military order against them. It is no wonder that divers Nati-

ons took counsel how to destroy so cruel an Army, whereas in divers places of Africa and Mur-

ritians, they are so numerous and malicious, that they force the inhabitants to seek out new

habitation. We observed out of Pliny, Varro's and Pliny, divers ways to break and destroy their eggs. At the entrance of the Spring, rivers are turned upon the places where their eggs are, so that they abundantly wet all the surface of the earth, or the greatest part of it. If the place be so situated that they cannot do this, multitudes of men trample over the ground, so that no

place is left, that is either higher or deeper than the rest; if they cannot prevail with their feet, they use a drag, a harrow, and a scythe that are very heavy, such as Countryside men use; that they may the more easily blame them, and level the ground the better. Also abundance of military Charities would do no hurt here, for by frequent and often running up and down with the wheels, they would break the eggs: I should also commend the use of the plough, which would dig and turn up the earth, and cool the nests of the Locusts. Some counsel to fright the old Locusts with ringing Bells, sending Trumpers, beating Drums; and by discharging great Guns, to make that terrible Salomonean noise that may drive them away; some think that by great cries and shoutings of men, they may be terrified, as if the beating of the air might shake them, or, as though they heard any of those terrible noises, as some absurdly dream. Others make deep ditches in the fields, and with crackers that beat the air, drive the fearful Locusts either by degrees, and when they are come into these ditches, they are suddenly overwhelmed with earth, or calling in rubbish, they cover and destroy them. Some affirm that they are taken with pickle made with Locusts, that by it they fall suddenly into a deep sleep and afterwards dye. By these arts, Sisineu, Varro, the Locusts that vexed the people about Arliso were destroyed in twenty daies time, in Syria they fight against them in a方netherly posture. In the Island Lemnos, all Souldiers are bound to bring a certai

n measure of Locusts to the Magistrates every day. Some Nations, as I said, feed Jackdaws at the publick coths that as occasion is they may destroy the Locusts. Moreover the birds, name-

ly Storks, are called Selenitas which the inhabitants of the Mount Caisan formerly obrain'd to be fent by Jupiter against the Locusts that destroy'd their com. These birds come yearly to help them, but whether they fly back, or wherence they come, no man can tell. So soon as the Locusts are destroyed they forsake the Mountain, and go home again. Our new Author mightly commend the smell of Brimstones, and of gum-powder, and think they will kill Locusts by their smell; but if a cloud of Locusts or swarm come tumbling into a land, let all the inhabi-

nants lie cloze in their houses, for if they see no man in their journey, they will readily pass over that country, or else they will easily remain in that place. But if they come before it be observed, they will touch no herb nor corn, nor any thing that is sprinkled with the decocti-

on of bitter Lepidons and white Cucumbers; for they pen'ti to soon as they touch them. It may be the decodion of the leifer Cacumen- Worwood or Walch, that would do the fame. Al-

so they are glad to pale from those places where bats are hanged aloft on the trees. Moreover, if you burn Locusts taken in pits, the same way as I said, that flame will either chok the flame that are near, or will make them fall down, that they may be easily taken with your hands, or they will dye of themselves, being afterwards weighing with the Sun. If you would defend vine

from
Chap. XVII.

Of grashoppers and kricketes.

Of all the Insects making a shrillious noise, the Grashopper challengeth the chief place, and by great right too. For in the heat of the day he sends forth a most thrall and musical sound, sustaining his life with dew without doing any harm to be or trees. Amongst the Greeks he hath divers names, according to the diversity of Countreys, generally and by a common name he is called Τττη, by the Eleas, Λοκατμας by the Sideris, Κοιης by the Cretians, (as Bellanion faith) Αθηναυης by the Countreymen of Smidas, because it lives by sucking out of the dew. They attribute also divers names and appellations unto it from its sex, age, bigness, and tinging. For the female which doth not sing at a Αλλιοι calls Κωνοις; Stephanus, Καιλονος, that tinges not; Euathius thinks it is not a Grashopper, but another kind of creature like it. So doth Athenaeus s. 4. from Spemphoros, τελωθινος, the common τελωθινος, like to a Grashopper, or the Bird called a small Turtle. Indeed the words of Livius out of Alexis cited by Athenaeus in his Θεοσo give in a large testimony to the same, both that the Cercop has a voice, and was of a divers kind from the Cicada or Grashopper (I never saw the female Cercopes, nor the Pye, nor the Nightingale, nor the Grashoppers male) unless perhaps the Grecians were wont to keep together in their cases the male and female Turtle, so we should say they joynted together in like manner, the male Grashopper and the female Cercopa; for that they did not only keep them together with the Pye and the Philomel, for their singing fake, but that they might behold their mutual embraces, dalliance and lustful pleasure. Add to this that Athenaeus calleth it ηλλενις, or the more taltitative; so far is he from attributing all the busines of tinging and making a noise to her male, contrary to the custom of the female.

The Grashopper when he is come to be old is called τετες, when young and tender μελις & μελιν, as Hesychius observerth. The little Grashoppers (which Gaea callath Cicaspharos, and we Cicada) the Greeks call μπαλμα & μπαληθες, which signification I wonder that it is called over by Stephanus. The word μπας, put sublimate, signifieth the last Grashopper of all, as Φλαθίς witteth, τεθπιθανε ιπθες also do figure the latter Grashoppers, as we read in Callius although Επιθυμα will have them to be creatures of another species, like to Grashoppers as otherwhereth he calls them the females of Grashoppers. Their Επιθυμα will have so called of the Greek word μπαπαπαπαπαπαπα, from the found they make. The more vocal and obstreperous of them called Επιθυμα the Athens, or the Males, making indeed a very pleasant and musical noise. The other being mute and more wide are called Επιθυμα, from their silence, as also Αγαθοι. In Arabick Γιατρος, and Cicadae Valsaertrische and Robiche. Silvan. Cicada is a barbarous word of a Latine or Spanish word corrupted. In Italian Littalo, Cicara, and otherwhre Lactaera; in Spanish Cigarrocas, and Cigarras; in Germany and England I do not hear that there are any Grashoppers to be found, but if they be, they are in both Countreys called Berekrics, or Saulm Kricketts; in Flanders, Federden; of the Walloons, (if I mistake not) Straffen; in Polonis, Komkcz, Ζηλοθες, Spieca. Sometimes the name Krickets and Grashoppers, are promiscuously used, which cannot be, unless you will say that the Kricket is a Grashopper without wings. The Latines as
The Beater of Insects: or,

Book I.

Some that have after words will have it derive the word Cicadas, grafh into cadens, (i.e.) quickly railishing. And that indeed is the Epitath that Aristotle gives it, σχιστος πτερω, the short lived Grafhopper, so to indeed it seems to be.

Of the Grafhoppers, some are more common, others more rare. The common and ordinary to hath the head big, and bending downward; and is of the figure of a Penticson terminated with unequall fides; it is of a blackish green colour, having on each side two branches or boles of the same colour, but of an oval figure, and edged about with a dark coloured margine, and a line or Sreek of the fame running along cuts the boles in the middle, & the letter β of a pure black colour parts the head right in the middle; it hath eyes of somewhat a dark green, prominent and big, considering the bulk of the body; insomuch that I wonder that <N>igidius (that denies that they have any eyes) could not see them. But indeed as Aristotle faith they are very dull sighted. For if you bend your finger and put it back toward their eyes, they will rather come towards you then go from you, and will the sooner get upon your hand being drawn thereunto by the shadow of the finger; the head or rather the face looking upward, appears of a weak green from white.

The Grafhopper amongst the Insects, is the only one of the kind of creatures that is without a mouth, but hath it otherwise supplied by a long kind of compact falt infulence, which like a pronuncifus fupplieth the place of a mouth and tongue fashiond rounded and hollow like a pipe or gutter, referved for the moist part within, having ren freek running athwart it, with which it fucks the dew, the only nutriment that it hath; and which is peculiar unto it, as Virgil faiths, Parvens dum vortre Cicade: Whence it is in Athenaeus that the question is controverted, afterward concluded that water alone is able to maintain life, because with it alone the Grafhoppers are fullained. Hence it is that elsewhere he repeats the saying of a certain Paride to this purpose <Оп им встрицу ыезем>, i.e. I am not such a one as

live on dew nor herbs. And that of Thessalian it is very like it: Doth he live on dew like a Grafhopper? Away then with that Fable of Aristippus which is commonly received, that the Grafhoppers begged food from the Ants, for we may learn out of Plato, that the Grafhoppers are condescended to Apollo, and the Mites belowed on them this boon, that they should live only by singing, not so much as mentioning the dew. We shall also pass over those inventions of Tzetzes as not worth the mentioning, who reports that the Grafhoppers are always provided with food in great variety. It is reported by Antonius Alimarianus in his Book de Mannis, that the Grafhoppers do suck the juice out of the bark and leaves of the Ash-tree, or Elm chiefly, the which we call Manna, but yet it is more likely that they suck it off from herbs out of them, as the Butterflies do, both because they are always found to be empty within, and for that they are not perceived to void such things unless it be when they have taken in a little more dew then ordinary, they call out of their bodies the superficiality thereof, as the Countrymen have observed.

The body is fainned to the head by a very short neck, or rather none at all indeed, the shoulders are spotted with green and black, the breast is of a bright green well towards white, out of which come three feet and thanks on each side of a leek colour; the belly in the bigger part is two fingers in length, and one in breadth; the inner part of the belly resembles a target ending in a sharp point, and is compassed about with an hem having twelve or thirteen joynets in it; within appear certain incurus of the same colour with the belly; the males (that is, the leaf of the two) have the end of their tail forked; the females on the other side whole; their back is blackish with seven or eight green lines or incurus drawn athwart the same; the wings very curius, of a silver colour, and painted with dusky spots and specks very trim, the outermost twice as long as the innermost, and more various; the dark brown is more rarely seen, which Lodovicas Armachus a very diligent Chirurgeon, brought from Guinea, and gave to Peninnis: also Mr. White a rare Painter, gave him another brought forth from Virginia, it was all of an azure colour, (it may be it was that the Greeks call θησιος) but it was like the former in proportion, it hath both its wings silver coloured, but not at all, spotted, and the former green ones were. Those that live in quickers are most green and big, those that are found in oars, or corn, or grables are of divers colours according to the place where they be, and are far leele then the rest.

But if we compare their Nature and conditions with mans, they being our servants, do excel their Lords and Masters in virtue; and may teach us manners. For they flew forth that harmlessness of conversation, that they will not hurt or abuse any creature; but we perfuting the right
right use of things, can find in our hearts many times to abuse even our parents themselves. What grief will be content with the diet of the Grasshopper; that is simple, mean and frugal, not inquired with variety of dishes, or cookery, or curious mixtures: ye faire hath foolish curiosity prevailed with men, that unleas flesh of contrary nature, and with them fruits, leaves, spicles, liquors, be drested together, they think their appetite satisfied, & their palat very much wronged, manifesting that clean and wholesome diet of their forefathers. Those can quench their thirst with a little dew: we with our diversity of mixtures do rather invite and increase thirst than allay it. They living in summer near to the earth (in which they had rather sing) yet notwithstanding lead a cheerful life, and with their high strained notes, do make the lowness of their condition more easy to them. But we men if call from any high place, we presently despair, and are afraid at every turn of the wheel of Fortune.

The Grasshoppers hold on singing from morning till night; without intermission, very pleasant and agreeable, whereas many Preachers neither preach well nor often, scarce four times throughout the year: truly they may be ashamed being bred more civily, to be admonished of their duty by a wilde musician. These if you scratch o: tickle their belly (as Poets which were commended) sing more shrill; but those speak them as fair as possible may be, yea invite them with gifts, yet (like the Argonauta of Martial) neither the care, nor lift up their eyes or hands to the skies. Moreover these agree all together in one tune, and perform their mutual help in their affairs. But I would to God these did not wholly busie themselves in sowing frithe, and breeding controversies, that they did not wrangle together about wool and flax, figures and forms, and ceremonies, and of things decent, undecent and unfeemly. True is the proverb of Theocritus concerning them, ἔνιος ἄρσεν ἔθησεν, the Grasshoppers are a friend to each other, but man who ought to be a God to man, rather proves a wolf and a Devil, and putting off the nature of a man, tears up his own bowels.

Amongst the Grasshoppers the females are silent; the males do in a manner loath ventency, neither are drawn unto it but by many enticements of the female. But our women have more tongue by far than men; and the men behave themselves more licentiously than women. What is to be added further. The Grasshoppers of all other Insects seem to be without passion, but the perturbations of our minds do carry us on so headlong, that upon every slight caule, yet none at all, we wax hot with anger, pine away with grief, burn with envy and jealousy.

Now for the music which the Grasshoppers make, amongst all the Insects there is none like it; accounted to sweet amongst the Ancients, that they equalled it to the sound of the Harp, as Pausanias wrote; and it may be Lucerius therefore called Grasshoppers Teretes. When Simon Sillographius would commend the eloquence of Plato he compared it to the music of the Grasshopper's; his words are these: Plato sings sweetly, and as well as the Grasshoppers. They begin to sing in the heat of the day, even at what time the reapers would otherwise leave work, who else those laborious chanters get them up into trees, and there fill the ears of the Laboureers and passengers with their melodious noise. For as music is a kind entertainment and recreation to the flaring spirits and tired brain, so the unaffected notes and lays of the Grasshoppers, and the exuberance of their contention in singing, doth serve as a spur to provoke men to endure labour,
labour, and doth not only invite the reapers to gather the fruits, but detains them in their work.

Of the strife between *Eunomus of Locris* and *Arifla of Rhegis* two Harpers, and *Eunomus* getting the better, by reason of a Grashopper flying to his harp and sitting upon it and supplying the place of his broken string; read *Antigonus Mirmabolium confat. l. 1. & Strabo Geograph. l. 6.* Of which contention also *Solinus* makes mention; and indeed the Ancients by the Grashopper understand Mufick; and therefore they painted the Grashopper sitting upon *Eunomus* Harp, as the known Hieroglyphick of the Males, as *Strabo*, *Polegenon* and *Panfanius* give us to understand.

With the *Athenians* it was the fymbole of Antiquity and Nobility, and to that end (as now the Spaniards doth the golden Fleece) so they wear golden Grashoppers embroidered on their Hairs, from whence they were called *Myrippogeth.* The Author of the Anthologies faith further in his third Book, that the Ancients had the Grashopper in such veneration, that they made a monument for it in the Promontory of *Tanare* in the Country of *Laconia*; and engraved a very elegant Elogy thereupon in its praise; to which *Orms Apollo, Heryocly, 2.* doth subcribe. In a word, there is none to whom the musick of the Grashopper can seem harsh or impalebeat; but is either not well at cafe in his minde or his body, and so can be no competent judge of musical strains. The Grecians had them in such estimation, that they kept them in Cages to please their ears with them.

Now to add something concerning the manner how they make this noise, and then to proceed to their original and death. This fridulous and obturerous noize they make, some think to be caused one way and some another.

*Pierius* thinks it is formed in the fount or promusici: *Proclus Diadichus* by the rubbing together of their wings; a *Hippocrates* more ingeniously points forth a kind of fong; that is, *The Grashopper sings by frequent clapping of its wings together* and it makes a noife. And the fame thinks *Hesiod.* But that they sing not with their mouth all men know, as neither by the rubbing of their wings together as the Locust doth; but by the reverberation of a little membrane under the flabeis; (so they call those two coverings behind the hinder thighs cleaving to the belly) or as *Aristotle* describes it in brief. They make this noife by reason of the air hissing against the membrane under the midrife; for by that means it being defended or remitted, and forced up and down, there breaketh forth a fridulous sound, fuch as the boys make with their reed or oaten pipes, which have a thin skin, which being puffed down, flaken or intempest, it must make a found. And this is the reason why the female Grashoppers sing not at all, because they do that space between the thighs, where this thin membrane grows in the males and caufeth this found. Others make the females to be more cold by far than the males, and that they make the caufe of their silence. But *I<ommius* old men, and old women, make most noise and greater than young pofitons that are more hot, therefore frigidity cannot be the caufe.

Add further (if we will fland to the judgement of *Hippocrates*) that women are more hot than men; but if they be not so, yet it must needs be acknowledged, that the female Grashoppers are more hot than the males, becaufe under the midrife they are not so divided, but the males in that place (were it not for that little membrane to hinder) they might easily be blown through. Nature certainly intended by denying a voice to the females of thefe Grashoppers to teach our women that lefion: *δωρον γενομενον αυταις τινι ονοματος what ornament silence brings to the female sex."

They begin first of all to fang about the latter end of the Spring, the Sun being gone paft the Meridian, and per chance in hotter Countries sooner; where quicksets or thickerks are more rare, there they live more happily, and fang more willingly. For they are of all creatures the leaft melancholy, and for that reafon they do affect not only green and pleafant places, but champion and open fields. Yet they are not to be found in those places where there are no trees at all, nor where there are too many and too fhyd. Hence it comes to pafle, fay *Arist.* that at *Cyrene* in none of the fields there is there any Grashoppers to be found; whereas near the Town they are frequently heard. They flun alto cold places, indeed they cannot live in them. They love the Olive tree, becaufe of the thinnes of the bough and narrownes of the leaves whereby they are lefle fhyd.

They never alter their place, as neither doth the Stork, or at leaft very seldom; or if they do they are ever after filent, they fang no more; so much doth the love of their native foyl pre vail with them.

In the Country of *Melitus* (faith *Pliny*) they are feldom feen. In the Ilond *Cephelenia* there runs a River, on the one fide whereof there is plenty of them on the other in a manner none: that which I fould take to be the caufe, is either the want of trees or the too much abundance or elfe a certaine natural antipathy of the foyl; as *Ireland* neither brings forth nor breeds any venomous creature: for the fame reafon they do not fare the Kingdome of *Naples*; al though *Niphus* tells us that to be done by the enchantment of one *Mero. Timaus* that wrote the *History of Sicily* that in the Country of *Locris* on the hither Iide of the River *Hel licis* they are marvellous loud; on the other Iide toward the city of *Rhegis,* there is none one to be heard: they are not therefore silent becaufe *Hercules* prayed against them for difturbing him of his flees, as *Solinus* fabulously relates; but because they are more merry and joyous at home;
as the Cock is: where it is that the Lucian Grafhoppers will not sing at Rhigium, nor theirs on the contrary near Locria; and yet there is but a small river runs between them, such a one as one may call a stone over. Much certainly doth their Country (which comprehends in it all the love that may be) move them: where like the people of the Jews, they refuse to sing their native Songs in a strange Country; who being call'd out of their own habituation, seek means to die rather than waies to live: to prodigal seem they of their short life, and delirous after their native dwelling.

They do to affect of men, that unless they see fields full of Mowers or harvest folks, and the waies with passengers, they sing very low and seldome, or silently to themselves. But if once they hear the reapers making merry, talking and singings (which is common at noon) then they sing to loud as if they flrove who should sing loudest, together with them, Wherefore not undeservedly was the Parable in Athenien called wise, who being naturally obfemious by nature, yet was so full of talk, as if he frove that no body should be heard at the table but he. 

Socrates in his Phaedrus relates the History of the Grafhoppers very witty, warning men not to sleep in the heat of the day, left the Grafhoppers mock them: for the Poets report how their diligence was highly rewarded. For they lay that the Grafhoppers before the Muses were, were men: who afterwards when the Muses came taught them to sing; but some of them were so delighted with music and singings, that altogether neglecting their mealt and drink inconveniently, they perished; the which afterwards being turned into Grafhoppers, the Muses gave them that for a reward, that they should be able to live even in the heat of the day without meat or drink, neither to have any need of blood or moisture.

They couple and generate with creatures of the same kinde, as Arifiole tells us, and the male casts his seed into the female, which the accordingly receives; they bring forth in fallow grounds, hollowing it with that sharp picked hollow part of their tail, as the Bruchus doth, and therefore there is great plenty of Grafhoppers in the Country of Cyrene. Also in reeds, where the vines are propped, they make hollow a place for their nest; and sometymes they breed in the fuels of the herb Squilla, but this brood soon fails to the ground.

This is also worth the notice, which Hugo Solerius writing upon Aristotle affirmeth, that the Grafhoppers dye with bringing forth: the ventricle of the female being rent splitter in the birth (the which come being very much deceived therein, do report of the Vipers) the which I exceedingly marvel at. For they lay white eggs, and do not bring forth a living creature (as the field mouse doth) unless it be by reason of weaknes: of the egg comes a little worm, of that comes a creature like to the Arctia of the Butterly; which is called Tettigomes, (at what time they are very delicate meat: to be eaten before the shell be broken) afterwards about the Solstices, in the night come forth of that matter, the Grafhoppers, all black, hard, and somowhat big. When they are thus got out, those that are for the quicksters, betake themselves thither: those that live amongst the corn, go and fit upon that, at their departue they leave behind them a little kind of moisiture; not long after they are able to take wings, and they begin to sing. That therefore which Solerius Reignede concerning the burfting of the womb of the mother, I therefor conceive neither to be understood of the matrixes.

A certain woman did bring up some young Grafhoppers, for her delight fake and to hear them sing: which became with young without the help of the male, if we may believe Arif. b. 1. de hist. anim. but since he hath told us that all the females of Grafhoppers are mute by nature, and this spontaneous impregnation is far from truth, either the woman deceived Arifiole, or he us.

There is another kinde of Generation of Grafhoppers, that we read of. For if clay be not dug up in due time, it will breed Grafhoppers: so faith Paracelsus, and before him Hisbeus. For this cause Plato faith Grafhoppers were of old time men born of the earth, but by the favour of the Muses turned into that Musical sort of creatures, the Grafhoppers. Even at this day retaining their lives with no other food than dew, and feeding themselves by continual singings they live. For this cause the Atheniens were called Tettigophi; because they wore golden Grafhoppers for ornament in their hair, and for a token of their nobility and antiquity; as Thucydides 1. Syroporp, and Heraclidus Ponticus de praefio Athenieniibus celleth. Erythoes makes a proof of this custom, being born of the earth as they lay, who first governed the Common-wealth of the Atheniens, and they too in the judgement of Plato the Natives were Erythoes, i.e. born of the earth. Afterwards it came to be a custome that none but an Athenien, or one born in the place might wear a Grafhopper in his hair; of this origin is Aristoph: as also his Scholiast.

I doth faith that the Cuckow-spitlle doth generate Grafhoppers, which is not true, but that it produceth small Locusts is manifest. Lucretius in his 4. Book, faith that the Grafhopper in the Summer doth fliet his skin, according to this verse:

Cum veteres ponunt tunicae at state Cicada;

And for that reason he is called by Hesychius, p(afpho, i.e. the naked Grafhoppers or without a skin: whom I should not have believed unless I had the picture of the skin so call'd off by me.

Before Copulation the Males are of the more delicate taste, afterwards the females, for that they
they have in them white eggs very pleasant to the palate. The Parthians, as Pliny writes, and the rest of the eastern Nations feed upon them; not only for nourishment, but to open their veins, and to stir up their languishing appetite, as Athenæus in his 4. Books, and Natural comes expressly affirm. Hence Aristophanes in his Anagnus out of Theoricius, writes that the gods did feed upon Grasshoppers; at what time they had lost their appetite through cholery or putrid. I have seen, faith Elian l. 12. c. 6. those that sold them tied in bundles together for men to eat, to wit, the most voracious of all living creatures did fell the most jeune, lest any thing should be lacking to their exquisite dainties.

Diocondas gave a roasted Grasshopper to eat, and, faith they are very good against the diseases of the bladder. Some, faith Galen, use dried Grasshoppers for the Colick; they gave according to the number 3, 5, or 7 grains of Peppers, and when it goes off as when it comes on. Traianus bids to give them for the Stone, dried and beaten, the wings and feet first all taken away, and this to be done in a bath, with figues and Hippocras. Agines use them dryed for the Stone in the reins, and for the diseases of the reins he composed the invention called Diastigmen. Such another like Antidote doth Myceropus prescribe, but all heads and feet as superfluous members being cast away. Luminarius hath transcribed an Eleusian out of Nicollus of this sort. Take Grasshoppers, their heads and legs cast away, two ounces, Cromiumm; feed, Saffage feed, each 1 ounce; Pepper, Galanga, Cinnamon, of each 3 grains, Lignum Aloes half a dram; honey what is sufficient. Nicollus useth Grasshoppers burned and powdered, mangled with honey, and gives them about the bigness of a bean in a quantity of wine. Anisius three Grasshoppers beat in Wine. Some in stead of Cantharides use Grasshoppers to provoke urine, and in my judgement not without very good reason; for they are taken with leafe danger, and do work sooner, as well in this disease, as in the weakness of venery. Namus the Physician prescribes an Antidote of Grasshoppers, and Xenophyton, against the Stone in the kidneys. A recipe for the remedies of the bladder speaks thus of Grasshoppers; The last remedy for the bladder is a Grasshopper given in its time to eat (Males before copulation, but afterwards Females, as we finde in Aristotle) but out of their time, dried and powdered; boil them with water and a little spike; also let the patient fit in the same for a bath to ease the pains of the bladder. Some of our later practitioners, put Grasshoppers in oyl, and let them in the Sun, and mingle them with oyl of Scorpions, and anoint the privities of men and women, the testicles and parts about with it for pains of the bladder. Arnoledus Breviar. l. 1 . c. 20. & 32. commend the powder of Grasshoppers for the Colick, and Iliack passion, and also to drive forth the Stone; if half a Grasshopper in powder be drank with Goats blood, or Diuretic wine. Laframus highly exteems the ashes of Grasshoppers to break the Stone, taken with Radish water, or the decoction of chich Peaxe. Alfo they caufe idle and lazy boyes to hurt after them: Theoricius speaks thus of it in his first Idylum.

Hic in his ears of corn bound to a cane did make
A wish for Grasshoppers to hunt and take.

Neither are they only excellent meat, and very useful in Physick to men, but they feed Birds also, and inflame them. For the youth of Crete (as Belonius wittellyh) hide a hook in the body of a Grasshopper, and when they have fallen to a line, they caufe it up into the air; which the Merops (eing catch it and swalloweth; which when the boyes perceive they daют it to them; and so do excite their air-fowling not without profit and pleasure.

The Grasshoppers abounding in the end of the Spring, do force a sickly year to come, not that they are the cause of putrefaction in themselves, but only they shew plenty of purit matter to be, when there is such store of them appear. Oftentimes their coming and fuging doth potend the happy year of things by Theoricius, 3. lib. 2. c. 29. & 30. Niphon; faith that year but few of them are to be seen, they preface dearness of victuals, and scarcity of all things to follow. But whereas P. Languis (a Philosopher of great reading and learning, and a famous Physician) faith lib. 2. 47. that Grasshoppers did eat the corn in Germany as the Loculus do; Stemmarius, that it was done in Helvetia: Lygadibus lib. prodig, and the Greek Epigram doth affirme, that they eat the fruits and crop the herbs; truly (unless they mean a Locull in stead of a Grasshopper) they declare a strange thing, and (saving the credit of so famous men) I will not believe, for they have neither teeth nor excrement as hath been said, but only feed and swell with the dew. Besides, although I have gone over all Helvetia, Germany and England, and have searcht for a Grasshopper as for a needle, yet could I finde none. And therefore I suppose that both they themselves, as also Guili, de Conoye, and Albert. Vincentius, to have mistaken the Locull or Brachius for the Grasshopper, being deceived by the common error, who take the one for the other. They desire more of their nature and use, may consult the Authors of the Greek and Latin Epigrams, with praising them or dispraising them according to their own humour.

The egyptians by a Grasshopper painted, understood a Priest, and an holy man; the latter makers of Hieroglyphicks, sometimes will have them to signify Muficians, sometimes pat- lers or talkative companions, but very fondly. How ever the matter be, the Grasshopper hath furg very well of her self in my judgemente in this following Diftich.
Of lesser living Creatures.

*Sim lect infra genis exiguum atq; minutum; Magna tamen parvis gratia robun inest.*

Although I am an Insect very small,
Yet with great virtue am endow'd withall.

Next in order followeth the Gryllus or Cricket, both for that it refembleth it somewhat in the name of shapes, the wings excelled, but comes very near it in its note and manner of singing. *Calce* the Cricket, in spite of Pliny, calleth it from the harpies of the found 45th, but not rightly; whereas I have proved out of Arist. that this to be a greater fort of Locusts. *Friesius qwest. lib. from Pliny* calleth it *Tryzalus*; the which notwithstanding it be an Insect without wings as the other is, yet it is not at all like to the Gryllus in form or shape. It is called also in Latin Gryllus; in French, un*Grillon*, *Cryn*; in Arabick, *Surfar*, if we may believe Bekker. in Barbary, Gerard; of *Avicenum Algedes*; of the Polonians *Swierc*; Hungarians *Oresfer*; in Germany ein *Grilsen Heyme*; about Argentinum (from the month wherein it sings) *Bracht Vogel*; of the Illirians, *Swierz*; *Gryll*; of the English, *Kricket*; of the Dutch *Gricky*; Nachtieroet.

The Gryllus or Cricket is of two sorts, the field Cricket, and the house Cricket. *Pliny* refers them both to the kindes of Black-Beetles, but improperly, since they have not their wings in a cover, but only thin membranes, though the outmost are far thicker than those that lie hid under them. *Calcius* that came after him, makes it a kind of Locust, but his error is the same. *Niphus* in *Ariftoteles hist. 5. 28. et 29.* calls them ground Locusts and Branches, as also *Albertus* by ignorance calls them Grasshoppers. Of the field Crickets, some are males, some are females: the male is wolehig as big as the Grasshoppers, but the body somewhat longer, of a blackish colour, the head for the bulk of the body big; the eyes great, standing out, the fore-head hewed, but the horns without joynts, which notwithstanding are moved to and fro with ease. It hath fixe fea coloured like the body, the hindermost longer than the rest for the more nimblenes of motion and leaping; they go (as all the rest of the Krickets do) forward and backward; the wings as it were lightly engraven, and crooked, covering almost all the body, the tail forked, the body les that of that female; the having a bigger belly, is of an unlighty green colour; the eyes grafs-colour, the cornicles reddish, the tail three forked like a Trident, in bulk of body differing from the male. In the Summer they are found in the fields, making holes in the earth, and building their nefts. In a calm Winter they lie hid, in a cold and sharp they lie in their holes, the which they seem to have digged without the help of a Pioneer.

The noise which they make is caused by the rubbing of their wings one against the other, as *Pliny* witnesseth, *Jacob Garret* an industrious and ingenious Apothecary did the fame with the wings pluck off and rubbed together, very cunningly imitating them: inomuch that I wonder at *Scaliger* who saith it cometh from a kind of I know not what follicle and pipe placed in the hollow part of the belly; and at *Sabins* who ascribeth it to the collision or grating together of their teeth: the which *Pliny* also, but fallly, writeth of the Locusts, when as either of them through the narrowness of the passages of their holes do tightly rub their wings, whether field Cricket or domelick, they make but a small sound: but when they are out of doors and rub hard, they make a very shrill loud noise, yet not so at all without the motion and agitation of their wings: the which if you crop or pull off, you shall see all that noiseo preferently cease. In the heat of the clay (in which they are much delighted) and in the night also they sing before their holes mouth.

Their common abode is in pastures and meadows; they not willingly tarry in shady and opacious places, they seldom live till winter: *George Agricola* writeth.

*Ngidou* gives great credit to them, but the Magicians more; because they go backward and make a noise in the night, and make holes in the earth. The farther off they are, they make the shriller noise; whereas being near at hand they are silent, and through fear or suspicion presently break themselves to their holes. The *Kricket*, (faith *Albertus* l.4, c.7 exerit, 273,) if it be divided in the middle, or have the head taken off, yet sings and lives a great while after. The which if it be true, what shall become of that pipe in the belly of them in which *Scaliger* faith doth cause the sound? The children use to hunt them with a Plume tied about the middle with
with a hair, which they put into their holes, blowing away first of all the dust left the should hide her self again, and so is drawn out by the Pitturine. Plin. l. 29. c. 4, 7. But sooner and with less labour is the then take a long small twig or a straw, and put into the hole, and draw it out by little and little, out the comes presently to her holes mouth, as it was to ask what the matter is, or who offered that injury to her hole; and so is taken. From whence cometh the Proverb, Statius Gryllus, more sily than the Kricket; of him that for every light cause doth betray himself to his enemy, and witningly brings himself into danger. They live upon new Panick, ripe Wheat and Apples.

The house Kricket (if we may believe Albertus) is called of the Greeks κρική, but no such name can be found. It may be he took a barbarous word for a Greek; the English call them house Krickets the Germans, Heimgrill.

Plin. l. 11. c. 28, writing of the Scarabée (among which he falsely reckons the Kricket) hath these words: Some of them dig holes in the ground of others of them in the dry earth between the fire and the oven, making a great noise in the night. The Domeltick like the former be both male and female. The male is almost all over of a dullish colour, the back of a various dun, or rather black; the body long and much less than the field Kricket; the head almost round, the eyes black, the conille movable every way, in form and shape all alike the field Kricket; about the root of the middle feet two short white lines do crofs the back and adorn it.

In the months of July and August they fly, but not far nor long; and that like the Wood-pecker, or Hickway, with a waving flight, sometimes flying aloft with her wings spread abroad, sometimess depending with her wings close to her body: the tail is forked. The female is the bigger and longer bellied, the fly with four wings, of which the outermost are shorter, the innermost narrower and longer; the end of the tail have three prickles or brillites. Both the sexes fly, and leap and run, and that swiftly, they liek in greedilly the scum of broch, and barm of ale or beer; they feed likewise on the matter and liquor that come out of corrupted fleth or carriion. Of this Insect writes Albertus thus: The Gryllus or Kricket which sings in the night, seems to have no mouth as the field Krickers have, but there is found in his head a long thing like a tongue, and it growes above the outer part of the head, and that part is not cloven, as the mouths of other creatures; neither is there found in the belly any superfluity at all, although it feed on the moisture of flesh and fat of broch, to which either powered out or reserved it runs in the night; yea although it feed on bread, yet is the belly alwaies lank and void of superfluity.

The Kricket doth not only recreat men weare with labour, with their singings, but are good for phyfick also to drive away diseases. The Ancients (as Scaliger hath oberserved Exercit. 186, and found it by his own experience to be true) did use them in head of the Catehistic, and with the like succees. It being dug out of the earth with the earth with its is good for the running of the ears. Being rubbed between the hands it cureth the disease called St. Antonies fire, as also the swelling of the jawaes: but this Kricket must be digged out together with its earth with iron, and afterwards be rubbed; and so the patient will not only be cured for the present, but shall be free for a year from having the disease again, Plin. l. 50. 49. 5. 12. They cure also the Parodies, i.e. an Impudence or false coming of matter distillfled from the head into the kernels of the ears; whether they be bound upon the places, or the place annointed therewith, they serve alla together with their earth, to anoint the Kings-Evil. Their ashes mixt with oil, bring old ulcers to Cicatrice. The Kricket diluter in water is good against the Stone or difficulty of urine. Bellinon star used to drop the oyl of them into the ears of them that are diseased in that part; by that means taking away all the dolor and pulsation of them. Marcellus much commends the stroking of them upon the tumours of the jawaes, and binding them upon the same: and in the opinion of Haly being hung about the neck, they cure the Quartan Ague. Serveniu faith they cure the swelling of the Tonsils in this Puffich:

A Kricket with right hand on Tonsils prcs,
To kill the Kricket, gives the patient rest.

Children (as the Italiati do Grashoppers) do keep them in a box bored full of holes, or bags, to hear them sing in the night, giving them leaves of herbs whereon to feed, and so keep them all the Summer. They are kept in Africk in iron cages, and are sold at a great rate, as I have heard by some Merchants, so as to cause sleep. For those of the inhabitants of Feffe are exceedingly delighted with their thrill noise; as much as the Irish and Welsh with the sound of the Harp. With which also learned Scaliger seems to be not a little affected, when for their musick sake he kept them inclosed in a box, the which if he had kept in such a thing where they might have had aire he had not found dead after three daies, but able to live a long while: lib. de plant. For being excluded from the air they cannot live, which besides air and found have nothing in them, nor leem
Of lesser living Creatures.

To be any thing else. The last Summer I had a male and a female of them; but within eight days, I found the sides of the female eaten out by the male, which also it self two days after expired.

The Bird Lanius, as the learned Brenner hath observed, is fed with them. The which the faffens upon thorns near to her nest of young, for fear they should want food.

When they become offensive by reason of their number, thus they may be driven away or taken off. Take a good deep dish filled of water, and place it before their holes mouth with a good deal of oatmeal round about it; so the Crickets leaping up into the bowl are drowned; or if you mix water with Vitriol and inject it into their hole, they will be gone.

There is one little winged creature behind, which whether it may be referred to the Classis of Grafhoppers or Locusts I know not. For by that it flies in swarms, and eats the corn, it may seem to be a Locust; but in figure and shape it is likest the Grafhopper above any thing. The visage of this creature is wonderful resembling an Infant, it hath on the head a three cornered cap, in the top of which are four black spots; two often very long, the other two almost round between which you may perceive two very little points or pricks; it hath four wings, of which the innermost are folded double when it flies till that you would think it to have six wings. And there it may be were those Locusts of which Cursians have written out of Sigeberthin. In the moneth of August (faith he) in the year 874, a wonderful swarm of Locusts having six wings, and six feet, did fly out of the Eats, by which almost all France was destroyed. You would say at first sight they had a hood upon their shoulders; but if you look nearer hand, it is nothing but the upper part of the wings inclosed with a semicircle. The body very thick, of a black and dun colour; the hinder part of the wings were all full of black spots. P. Quickelbergin of the City of Antwerp, sent over this to Peninus out of Africa, the which I keep to this day in my flores house of insects, by the name of a young Grafhopper. And as little am I satisfied concerning the Tryxalus (spoken of before) it had its name it may be from gnawing or eating. But that it should be either the Bruchus or the little Herb-locust, Grafhopper, or Cricket, I cannot be induced to believe. Not only because Athenians, Pliny and other Philosophers are not agreed in that very point; but besides, because they do much differ in form and nature; and why I say may not nymphes be derived from nymphes, to make a noise? and if it be, truly it will beft agree with the Crickets, which because of the noise it makes, it may be as true of the Cricket, which Pliny very well distinguishes from the Blatta or Beetle, as by other things, so by the noise it makes; that which Pach. Camerarias son of the great Camerarias, and heir of his vestures first observed, Pliny advethed to rot 20 of them and to drink them with sweet wine against shortness of breath, and spitting of blood. The ashes of them in honey, applied to the rugged edges of ulcers takes them down; they are likewise exceeding good for the stopping of womens courses or monethly purgations.

Hitherto I thought good also to refer the water Grafhopper of Ron- dolin, whose head is like a pentangle, having as it were five corners, the eyes round and standing out of the head, not great but black; the cornicles very short, coming forth out of the outermost part of the mouth; on each side it hath three feet the hindermost longer than the rest; on the back it hath little winges or some coming; the tail forked, the belly oftentimes as it were cleft; the colour of the body some-what dun, or rather black and white. I found them in muddy and stinking waters, but the nature of it I yet know not. This differs from the land Grafhopper, both for that the head stands out more; and it seems to have some kindes of neck, and also it hath winges not fit for flight, but only to lift it self up. This is said to make a kind of a pleasant noise like the land Grafhopper, upon the leaves of the water Lilly, pond-weed, and other water herbs, The which I have not as yet heard.

Of Moths called Blattae.

Often men talk much of the Blatta, but few or none able to describe what the Blatta, properly so called are, neither do they give the least mark whereby they may be known; but gathering divers notions here and there do put them all together and confound them. And but that Pliny had brought some light to this Hiftory, the Blatta had altogether been omitted or left. First of all therefore we shall shew what insects the name of Blatta was given according to Authors, then we shall set down what the true Blatta and properly so called is. Now under the name of Blatta are comprehended both the worms growing in the ears, as also those Phalenes which...
which trouble the Hives of Bees. But since these doe the light, the other altogether shun it, why they should be accounted Phalens, I do not see. The Blatta also is a little worm eating clothes or books. So Horace in his Sermons, Blattarum & tintaum epilae & c. But Marius altogether differing in between the Blatta and the Tinea, and thereof to be creatures of several kinds.

It is taken also of the Moderns for the little worm called nip out of whose web silk garments are made. Some call the little worm that groweth in the grain in the low oake, Blatta, from whence cometh the Blattarian colour, or grain colour. So Turner, aduers. l. 18. c. 17. & l. 28. c. 23. The Blattarian colour is dyed with worms which come out of the grain of Cockles, out of whose blood is produced a most curious colour, not black, as some think, but a bright purple or scarlet. To which the Book de natura verrum & Guilel. de Conchoi do allent. The worms of the belly some call Blatta. Cardamines in one place calleth the worms that breed in meal or bran, Blatta. Gaze interprets the word ῥήχον as also ἀπόσπασμα, Blatta. The proper and right name thereof is ῥήχον; according to Pollux, ἀπόσπασμα; as also according to Lucian, deciding a man that was no Scholar, yet bought many books. The Italians call it Blatta, and Turma; the Hebræans Pintesta; the Germans: Stikell, Brotworms Brotpfahser, Malzgesafer, Springwibfell; they of Norimberg call one species of them by way of sport Schauhans, because it cannot endure cold, as Cereus virideth; the Illyrians, Swine; the Polishans, Molonzy; the Hungarianans, Mozy; the Spaniards, Ropa eva postilla. Now the Blatta is an Insect flying in the night, like to a Bettle, but wanteth the head wings.

There are three forts of Blatta; the foit Moth, the mill Moth, and the unfavourable or flinking Moth. Fraijns divides them altogether fallilly, confounding the foit and the flinking Moths one with the other, and making the ἀπόσπασμα to be the third species of them, seduced as it seemeth by Gaze's interpretation. That all of them when they are old do shift their skin; both Arif. hist. 8. c. 17. and Pliny l. 11. c. 27. do affirm. All the males are suppos'd to have wings, but the females certainly have none; they also are lefs soho more bulky and big bellied. All of them (but the flinking) run very swiftely, and die with cold. The male is foit, the female of colour more black, it hath a small head, whereout come two long comicles, every wates movable; the breath together with the thoulders orbiculare; in the body it hath feven incicroes; the wings are of the same colour with the body, it seldom flies, but (as the Oldrich doth) by help of the wings it doth run very swiftely; it hath a forked tail like a pair of Barbers cissors; it hath fix feet. It live about Privies or Lakes houfes, ditches and flamy foggy places, for the most part they are somewhat like the field Kricker, but of a more compact body, and with far more slender thanks.

In the Ship called the Philip; (which that noble other Neptune, Sir Francis Drake, took laden with spices) there was found a wonderfull company of winged Moths; but somewhat bigger than ours, sofer and of a more ivarthy colour. I have heard by many men of good credit, that there was one of these foit Moths found and taken in the top of the roof of the Church at Peterborough, six times greater than the common Moth which did not only piece the skin of those that fought to catch it, but it so deepeth that it did fetch blood in great quantity; it was about a great thumbs breadth in bigness and length, and being fluf in between two walls, yet after two or three daies got forth no man knewhow.

The Mill or Bake-hous Moth, I have seen : the Greeks call the female (if I am not deceived, because it had no wings) μακεις, μακης, μακις & ἀπόσπασμα: it is longer thicker, and of a more shining black colour than the ordinary foit Moth, with a little forked mouth placed as it were under its belly; the comicles like to the fisil, little hollow eyes; or rather eye-holes; the breast fourquare, with the four foremost feet fatned to it; the hindermost to the belly; above the thoulders appear as it were little wings, though they are not so indeed; the rest of the body somewhat thick, cut all over round about, circle or orbiculare wise; in the sides resembling the form of a faw, the tip of the tail and a fork growing on each side is somewhat like a Trident: these Moth Krickers take up their abode in warm places, as floves and bake-houses, and fuch like; let them be never so hungry, they will scarce indure to come into the light; or if they be compelled so to do whereby to get some food; they bereke themselves into the dark again with what speed they can; or else hide themselves in dust that they may not be found.

The third foit is fo unfavourly, and carries with it such a flinking smell, that from the same it is called of the Greeks ἄνθος, of the Latines, Fadida Blatta; i. e. the flinking
Of lesser living Creatures.

flinking Moth; it hath thighs sharp with prickles, as Pliny declareth it, the which mark of di- 

minution, if he had not expreth, perhaps this kinde of Kricket had not been known, or seen by 

me. For the black Beetles (especially the hairy ones) they are altogether of the same form, 

only the tail taken off. It is of a pure black glistering colour, very flowy paced as no crea- 

ture the like; the body so framed and ordered, that you would swear it were winged and had 

sheath wings, nevertheless none of them have any wings, nor the male it self amongst this fort of them, (what ever Pliny dreameth to the contrary) it hath thin flender long flanks; remains in deep cellars, and is a retainer to the 

Jakes; it creeps very slowly, but at the least glimpse of light, and whisper of talk she hides her self; a flametone creature, certainly, and most 

important of light, not so much for its ill favoured, but the guileness of its 

confidence in regard of the flink it leaves behind it, and of its ill behavi- 

our: for it frequents base places, and digs through other mens walls, and doth 

not only annoy those that stand near it, but offends all the place thersabout 

with its filthy favour. The mouth of it is forked, the back covered (as it were) with a sheath wing, to solitary a creature that you shall scarce find 

two of them together. Whether it be begotten of pure religion, or otherwise generated by the 

.commion of male and female, is not certainly known.

About Frankford near the River Min they are frequently seen, as also in London in Wine- 

cellars, and dark dungeons: the other species are more frequent in Bake-houses, and warm places. 
The flinking Beetle some confound with the Cimex or Wall-loser, a creature of the like 

quality; but not rightly. The inhabitants of Petnym have certain creatures which they call Aram- 

ers; Savius thinks them to be Butterflies. They are of the bigness of the Kricket, they go 

forth a great many of them together in the night time, and all that is in the house almost that 

is soft they nibble about and eat it. Lib. Navii. Butterflies I cannot say they are, because they grow, 

and do not fuck with their Promutics; I would therefore either make them to be Krickets, or 

some new kinde of Moth, or some creature mixt and made of both. In an Epistle of a certain learned nun 

sent to Gephe there is a description of another kind of flinking Moth. There is faith he a certain flinking 

flying Insect in Hungary that flinks beyond measure; I should call it a flinking Grathopper, 

but that is more like the Kricket. In Winter it defires the light; in Summer it thuns it, when it flies 

it makes a kinde of a terrible horrid noise, leaving a momentome flink behind it. Some there are 

when the air is infected carry this creature about them as some secret remedy, and adore it; 

say fome of them, which a hog would scarce do, will swallow them, so afraid are they of the 

Plague, and so desirous to use means against it. They are bred in wells where they are most frequent there 

grow as they say the most generous wines. & I have found it to be true by experience. So far Epistle.

All the younger Moths are whith, but at their full growth of a bright red or tawny. The 

flinking are as black as a coal.

Diverse Authors do speak of four other sorts of Moths, viz. the Venereal, bred in the genitals 

of men; the Bee Moth, the Cloth Moth, and the Library or Book Moth; from eating of the Books: 

but none of these, but the Bee Moth agreeeth with the defcription of the Moth: but that neither 
is so flinking as the one called Blatta, or so foist as the others before described; but of a more 
dim nature, rather poultered with meal than announced with oil. Of the rest of these we shall 

speak more fully when we come to speak, God willing, of the Lace and Moths called Times.

Much variety of opinion there is among the learned of the colour of the Blat Moth, or the 

Blattar colour. For if these Insects (of which we have now treated) are the Blatta truly so cal- 

led, why should not the black be the Blat colour, rather than red purple colours? Certain it is, 
it is that the Bizantine Blatta yeelds a purple colour, as that of the worm Cocinenal doth a red or 

scarlet; either therefore all colours may be called Blattar, or else this last of ours is not one, 

Indeed I wonder at the boldnes of Turpinus and Thylus, which will have that of the worms 
to be the Blattar, when as they are of no Author called Blatta; but rather properly it ought to 

be called a Scarlet red. The Blatanner colour therefor, to say the truth, is the Purple, nor- 

withstanding our Blatta send forth no such kindes of liquor; but are flies of the light, malle, cruel, 

rough, theewing, living of nocturnal depredations after an infamous manner, whence Servius 
calls them P Vendor inurn navigantes, night Pirates.

These little creatures, although they are hateful to nature it self, to Men and Bees, yet God 
hath endued them with a dainty vertues, in which they excell the Blatane Bizantine. For take off his 
shell or nail, which is there between his head (called papaver) and its neck, what doth the belly 
contain but the ornament to dye withall and to delight the eyes with their colour? And be it 
so that Princes and great men will buy it though never so dear, and by the greatnes of the price 
made it only fit for Kings to wear; yet notwithstanding when you have heard the virtue of these 
Beetles otherwise so contemptible, you will say they are far more to be esteemed than purple. 
For they are wonderful good for the pains in the ears, taken after this manner: Take twelve 
Blats with their wings crop off, of old wine and honey and 3, and half the rind of a Pomem- 
rane, of the juice of an Apple & spoonfuls boil them well in a new pipkin till the rind of the 
Pomegranate be made limber and foist; then beat them all together which done, add quantity 
Syracuse 3, of Tarne 3, the juice of 4 Onions priffled our what may suffice beat all these 
together and by them by for use; let this decoction be droped into the ears, and a lack of
new from wool is kept in warm. Galen [see loc. l. 3. Experience witnesseth that the foil Blars boyled in oil and put upon Warts are so good effect. The mill Blar, the head being taken off and the body bruised, doth cure the Leprofe, as Mafe and Pithen have left in their Receipts. The fit of the tinkling Blar, when the head is off, beaten with oil of Roses, Galen out of Archigenes faith is very good for the ears; but the wool in which they put it, must by and by be taken out: for that the substance will quickly breed worms. Others write that two or three of them boyled in oil, bruised and put into a little limen bag and applied, are very good for the same purpose; their entails beaten with oil or warm water are likewise good for the same, being dropped into the ears. Pliny faith, l. 2. c. 36. that from the two fat the heads must be pulled out before they be used in medicine; from the tinkling, the feet and wings, or rather that crust or shell like wings on the back, that being more hard, and more poiyonous; but it hath no wings. The tinkling Blata moreover mingled with oil or pitch, are laid to cure Ulcers, otherwise incurable; as also Wens and Swellings in the neck, Botches being layed on for 21. days together: they cure alfo the Scab and Fellions; bruised and fettled Sores, the wings and feet being hit taken off. We did thin to hear of these things yet truly Diocorus (as Pliny faith) reports that they have helped the Kings-evil, and difficulty of breathing, mixed with Rotten and Honey: the most learned thought fit to keep the ashes of them in a horn box for this purpose, or the powder of them to put into the body by way of Clyfter. Cardan faith they take away pains; but what pains or what kind of Blata should do it, he tells us not. The Phrygians and Lycianians anoint those with them that have a lapponge in the Matrix. Pliny l. 36. c. ult. Latt of all they may serve in head of Caileourum for an Antibil ammon; and Galen with them in head of the Bupre fis.

Now if you would have a remedy against themfelves, cast but a handful of Flex-bane (the Greeks Mafcula is the Lazines Camilage) and all the Blats will gather together to it. So called in Rome Blatara or the Blat-herb. Nature hath provided a remedy against them for the Swall owes; they are wont commonly to ipoyl the Swallowes eggs, wherefore they use to fence their young with Parly or Smallage, whereby the Moths are forced away from their nests. The which might be thought to be the Region of Ethen, but that Zoroafte in his Gepocnikes doth affirm the fame. The Upupa or Hoare inclufe their nests with earth flax against Moths. The Chong, ufe the herb Vervin to the fame purpose. If they be annoyed with the oil of Spice, it works the like effect, as Pauch Camer. reports. That they may be rid out of Gardens, let us hear Diophanes his advice; Get the Guts of a Ram fresh killed and full of dun, bury it in the earth where many Moths lies, and caft the ground lightly upon it: two days after all the Blats will gather to it; the which at your pleasure you may carry other where, or bury them deep enough in the place, that they shall not be able to rise again. If you would prefer your Bees from them, use sharp fumigation, or set lights near to the Hives, or else anoint the props whereon they fland, that they may not get up.

**Chap. XIX.**

Of the Buprefis or Burncowe, and the Cantharides.

Many of the Naturall Philosophers have made mention of the Buprefis, but so little, that they seem neither to have touched either their form, or qualities, no not so much as their true Name. For Argyrun Cals it Buprefis; Vigelniueter. l. 3. c. 15. Cals it Vulpefer or Bulpefer; and in the 78. chap. Buprefis most corruptly Situatio; if any other chief at Barbarns-cals, it Bupferis, Bullifer, Bupfis, to corrupted was the Latine tongue in these blinde time, that Barbarn had wrought a general confusion in all places.

Now the true name of it is in Greek, ἱππος, which is from θαυμα το βίτα, glia bowes rumpes, because it uheels Owen; Nicander in Alex. derivs it ab incendendis bowes, from burning or enfaming the bowels of beafds. It is called in English Bupres or Bupris, in Dutch Bupris, Bupris, in Lowgale, Blintz or Blintz, and in Hindewite Bupris. They are not Buprefis keepers know full well.

For first of all by their acrimony they enfame the belly of cattle, upon which follows a tumor, and a fewer, and a kinde of a hot typanomy, by which in the end the bowels are burst. By other, as by Helfchins in like manner:却又, or Belfchins, which is more rightly ascribed to this kinde of red little Spiders, found in nature grounds, which doth ufe to bite them. In English it is called a Blintz-buck, or Trangy, which being eaten by carpel doth produce the like tyrromes; the Lazines retain the Greek name of Buprefis; of the Germans it is called Geuchs Gach, Knofller, Gouffler, die Grimm, Stuckhenden, Wildenmunde, Rencker, or of those of Heidelburg, from its swift running, ein Hlut-zuck; in Italian, Bupris; in Spanish, Arcemb, bufis, if Mathadus say true. But I for my part, somewhat boldly, though not improperly, do adventure to call it by a new name in English Burncow, or Burncow.
Pennins reports that he light upon one about Heidelberg, and a true one indeed, who describes it thus: it appears faith he, both in shape and quality to be a kind of Cantharides, both for its force and properties (if Galen, Aegypius, Phaenomenus, Actius, Plinyus and Avien to be so believed) but of a longer body, the outer sheath wings of a yellowish green, or rather of a golden yellow; the thighs also are longer and thicker, the eyes globous and prominent, out of the forehead, near the eyes come forth two long horns, joynted; the head small; the mouth is wide, hard, strong, forked, having teeth with which he doth cruelly wound and bite; the belly not round, but very long; a great toe to the Beetle and the Lizard, aiming at their bellies (as being the softer and more penetrable part) which presently the grawes through, and when they fear to be overcome or caught, presently the retreats and hides her self: somewhat strong of taste (as Altimanus faith) upon the palat. Actius makes it to have a ftarch of Nitre both in talfe and smell. Cornarius, Lomercius, and Cordus being deceived by the strong fmalill of it could not forbear to say it was the same with the Cimex or nofome Wood-pevs, and called it accordingly Knifer and Quefier. It feedeth on flies, cankers, worms, and other the like Insects; provided the kill them in fight, for those that dye of themselves or are kill'd by others, she will not touch: when the hath filled her self with the carcafes of the flats, what she leaves the draws into her hole, and when she is hungry again feeds on them. Other safeguard qualities of this little creature let Peter Turner and William Brewer (Physicians for learning and opinion of contradiction second to none) relate, who with the Pennius at Heidelberg did observe its life and manners. Bellomius in his description of Miscellaneous Actius makes reference to the true Buprestis thus: it is (faith he) a little winged flying creature of a most strong fenflike to the Cantharides, but greater, of colour yellow or clay coloured; of such exquisite poftion, that the cattle when they have fed there a little while, do die of the graffe infected with its contagion. It hath its abode amongst the herbs called Saccory, Flea-bane, Nerdles called Voupefis by the inhabitants of Mount Atlas. Thus far Bellomius. From whence we may truly collect that both descriptions of them do agree, as concerning their ill favour, their bigness, qualities; only they differ a little in kind and colour. For we have not seen any of them yellow, unless I may call a greenish gold colour yellow. Neither indeed is it for to stand too much upon the outward fhape or colour; but admit that according to the diversity of the climate, they may both receive some alteration (as it is in men) and yet be the same in species. Another Buprestis of the right sort I have seen, the body a little shorter, and broader about the belly, the tail more piked, the head small, the eyes standing out the mouth gaping, and forked, the fheath wing for the length of it, chamfered; of a full bright gaffs and golden colour; the legs but six in number, long, proportionable to the body. The Prints of Mathiolius and Grevenius, beyond the nature of the thing, and the experience of their own eyes, express eight and more flander, (considering the bigness of its body, than the first fort of Buprestis) and blackifies the cornicles also but half to bug, and smaller; it equals the fift in liveliness of pace, goeth beyond it in noytomnes of favour, yea in this it excels the Cimex of thinking wood-lowie her self, and all wilde creatures. It hunts after Flies and Canker-worms, wherewith it is fed; so vehement strong it is, that it will kill the most deadly Spider that may be. Flyes faith, that in Italy this creature is seldom found, but now (as we have reason to believe Marcellus Virgillius) they are more common than the flare of the country can well bear.

But that they are indeed venomous by nature, and very nosious to man and beast, as Actius witnesseth (for they kill both by their whole subsance) doth appear even by this, that those which should give them to any one to drink, were as Blandam faith in his Par
delpe, to suffer death, For in the Law runneth: Quis Buprestes vel praecampionem fictaminus confci, aut mortiferi quid veneni ad nocem acce
erandam dederit? Judicio capitulis, & patre Legis Cornelius afficiens, who
ever hath give a Buprestis or a Pine-tree Worm to drinks, to kill any body or any mortal poftion being found guilty of such wickednes, their suffer death by the Law of Cornelius. I have been about Heidelberg two Buprestes like Scarabæus, the one of a golden green, the other of yellowish black. The one like to the former which we have described, but somewhat bigger; the outer wings all over streaked with golden lines, and shaded with a little green; between the lines rise up boles curiously wrought; very swift of pace according to the common nature of that Infest, But that which is of a yellowish black was sent unto me from Vienna by Jacobus Quickelbergius of Aumper, who hath been a great help to me to enlatch this history. The colour excepted, and that it was a little bigger, and had four horns, it altogether resembled the last we described.
The Theater of Insects: or,  
Book I.

The Ute.  

Although these Insects are such as hath been said, that they fret with their acrimony; that fretting they enflame, and with their poisonous inflammation cause extreme thirst, and a horrible swelling; insomuch that the very skin is burst; yet hath Dame Nature made them not withstanding very wholesome, which Art afterwards hath prepared for medicine, before they be put in use.  

Plinius and Aegina dispute whether they should not be prepared as the Cantharides.  

Dioecetes dries them in a sieve over hot embers, and so layeth them by.  

Galen steeps them in vinegar.  

Hippocrates commands to take off their wings and feet.  

And because they fret, excelle, enflame and swell up, and do strongly attract and heat the parts so fretted.  

Dioc. l. 2. c. 59.  

faith, that being mixt with fitting ingredients, they may be applied to the Leprose, Cancer, and wilde Titters.  

My opinion is, that they may be used in field of the bigger parts or Cantharides, rather than some kind of Blates (by Paulus his leave, if I may say so) not only because they are somewhat like in shape and figure, and in virtue also, as Galen writeth.  

Pliny saith that the Bupreftis by way of corrosive doth take away Ringworms in the face.  

Hippocrates doth much commend them in divers diseases of the womb.  

For to be written in his Book of the Nature of Women; and in his Book of the Diseases of Women; and in his Book of Barrenness.  

For the hardnes of the womb, to emollient juices and fat added Bupreftis, and sticte.  

To drive out the Monely Flowers and secondistes, prepare half the body of a Bupreftis (whether great or small) with twice as much pulp of a Fig, and apply it; for it purgeth the womb, and inflate it, and is a special remedy to procure the Flowers when they are pait hope.  

Sometimes he applis only a Bupreftis (if it be a great one) sometimes making a foft peffary, he takes ten, and adds to them a little fauer of oyl, and mingles with it Wine, Aebiopian Cumin, Seufes, and Ammiede, of each alike parts, and whilest they are hot he makes a peffary of them and ufed them to the Matrix.  

In the strangling of the womb, when the fit is over, the body first purged, Hippocrates makes a Medicament with a Bupreftis, and thrusteth it into the Matrix.  

Alfo for a Schirrous of the womb he ufed a Bupreftis, but wary and with diligent consideration; for he puts it in like a Suppository for one day, and when it doth much vex the patient by corroding, he bids it to be taken forth: moreover he compounds a Bupreftis, Myrrhe, and Etherium, and puts it in.  

So he doth also to bring forth a Molis, Gal. l. 12. cap. 1. out of Archigenes, describes a Medicament of Bupreftis, with Vinegar, Crowfoot, and Wakerobin root, against falling of the hair, Leprose, Elephantiasis, &c. the cure whereof you may easily finde there.  

Now as I have declared hitherto its profitable qualities, to (left I should transgress the bounds of history) I shall open the terrible effects that this poisonous creature causest in man and beast;  

if a man swallow a Bupreftis, tis as all as if it had been a Cantharides; the body swelleth, as if it had a tympany; much wind creeps between the skin and flesh; which happeneth no doubt by the flux of humour melted by the poison, and the vapours elevated upwards.  

The lips are of a strong colour, wiu, of a dead violet.  

In the mouth there is the poisoning of the tongue, the stomach, belly, and guts do ak extremely, the urine is flops, the body is ill all over, as also the head and brain are sensible of it.  

The remedy.  

A remedy of this is Salt-pees, taken in Wine and Oxe gall.  

Useful to that purpose is womans milk, suck out abundantly, and in defect, cowes, goats, or fleeces milk.  

Womans urine drank, and vomited up again; but before a vomit they ought not be given; because by that means the Fever would be more sharp.  

Dioec. Frit of all therefor of good flour of Wine sodden, or with oyl of Myrtle Bacon Iard or Pork broth, or with good oyl of Olive, or boiled Wine a Vomite is to be made.  

New Drink drank freely, is held to be a special remedy against the Bupreftis.  

Galen and Archigenes. Pliny commands Nitre with water, or Latervorts, Aja dulce, Wine and Honey, or Bezoine dissolved in warm water; or take red Nitre 4. drams, and in warm water of Poica cause Vomit.  

After vomit there must he means used for purgation, afterwards use dry Figs (as Galen precepts) or a decoction of them in old generose Wine when the fit begins to be base.  

The Thebene dust is prescribed to eat alone, or bruised in sweet Wine or womans Milk: all kinds of Pears, and oyl of biosflomes of Apples, are much commended for this use.  

Nicander commends wood-pears, (for that I think he means by exwestes) and especially Myrtle berries following the authority of Dioscorides.  

For that they do refrigerate and bind, and by that means do asswage the hot nature of the Bupreftis, and help the weakness of the stomac.  

But heed must be taken they be not eaten while the body is yet swoln, lest the disease be increased by the poiyon being kept in.  

Some with good reason give 31. berries of bladders Nightshade, and with Almonds the make Almond-milk, together with the decoction of Lettuce, Violets, Borage, Buglois, garden Nightshade, Plantain, Raisins, and the great cold Seeds.  

Acinis gives the root of Scorion-grafs in sweet Wine to drink.  

Many extoll the wings and feet of the Cantharides for an Antidote against the Bupreftis, but either it hath an opposite quality by antipathy, which makes good that opinion, or else we may suppose it to be false.  

If an Horse or an Oxe eat one of these flies, presently he swells, growes mad, and shortly after burrest and dieth.  

So Aeian, 6. de Anim. c. 35, and Hierocles a Greek writer witnesses it.  

He bids to binde the horses head, and to open the veins about his noffles, that the blood may run forth of his mouth, and to rub it with Coleworts, and give him Fih-pickle and Oyl: and Vegetine likewise almost in the same words: If a Horse or an Oxe eat a Bupreftis with the grafs, his belly will instantly swell, he is inflate all over, he refucheth his means, and he often and by little and little sends forth his dung.
To cure this, 

\[\text{Abstain and tinge with the same remedy: presently get upon the Horse and cause him to gallop as fast as he is able, afterwards let him bleed a little in the roof of his mouth and let him swallow the blood as it runs forth, chewing it in his mouth; then keep him continually walking; let his diet be wheat steeped in sweet Wine with Leeks given him with a horn in Wine warm well beaten with Raifins. Some, as \text{Praeulius} taught them, pour Oyl into the nostrils of the Oxe; l. 17. c. 17. To Goats that are swolen with the Buprestis, apply Bacon-lard, or pour the fat broth of it down their throat, faith the same Author.}

The \text{Cynopteris} seems to be the same with the Buprestis, for that works the same effects in Dogs as this doth in Cartel; or if it be a different sort of creature from this, I confess ingenuously I have not met with it.

\[\text{Chap. XX.}

\text{Of the Cantharides, or Spanish Fly.}

\text{I know not what the reason was that the Cantharides above the rest are so well known, of so great use in Physick were omitted by \text{Pennius} and \text{Gerber. Which task notwithstanding I shall willingly undertake, and thus I begin their History. The word \text{Cantharides} in Greek is the same in Latin; in French, it is \text{Canarde}; in Italian, \text{Canarola}; in Spanish, \text{Cebilla}; in the German Tongue, \text{Granne, Kaffers, Goldkaffers}; in Low Dutch, \text{Spaensche, Dielebe}; in English, \text{Cantharides or Spanish Fly.}}

Of the Cantharides two sorts have come to our knowledge, the one greater, the other lesser. Of the greater sort there are some thick and long, taken in wheats; and fat likewise as the Blats and drawn with variety of golden lines, which in the wings run athwart, and those are accounted of the best use in Physick. Others are lesser and lean, hairy, called the innermost, not so fit for medicine. Of the greater sort also not all are of a glittering green, but some of them of a red, but all of them of an inexpellible splendor, and very pleasant to the eye.

The smaller Cantharides \text{Thomas Dreyce} first of all acquainted me withal, they seem to differ a little in shape and bigness; but have all the same virtue and original. Of these lesser, the first hath a long forked head, with black eyes standing out, the cornicles long and black, the wings coming forth of the middle of the loin; the which are marked with two silver coloured spots, and a few other white specks. They are commonly found in 

\[\text{Keeses, or Asle Partly in the summer time. It hath feet and thighs very tender and long; of colour virmilion inclining toward a purple. The second is of the same colour with the first, but only that the eyes and cornicles seem to be green. Of the third the head and shoulders are not to be distinguished, of a rufy colour, and the eyes as black as pitch; the wings of like colour with the head, but glittering with golden streaks, the feet black and short. The fourth is like the third, but only it is rufier in colour of grafs green, not rufy as the other; otherwise, except the bigness (for it is the least of all) it doth not differ. As well the greater as the lesser of these Cantharides, do not come of living creatures, but of dry and moist pustilation. The race of Cantharides is bred in wheats and corn fields, and in fig-trees also. 

\[\text{Thomas, as in his Book and Chap. They are bred also of the sponge of a Roke called \text{dem Carinus}, and of the Caterpillars which are found in Fig trees, Poplar, Pear tree, Ash, Olive, Roe trees; for in all these there are worms bred that are the originals of Cantharides, but in the white Roke they are less effectual. The Cantharides couple and generate likewise, but not a creature of their own species, but a worm only; they feed upon pulp and grain, but espically of wheat, and those which are so fed are accounted most fit for Medicine: they smell like Tarte, taff like Cedar, as \text{Nicander} reporteth.}

Their virtue consists in burning the body, causing a crust, or (as \text{Diocides} will have it) to corrode, cause exsculation, and provoke heat; and for that reason are used mingled with medicines that are to heat the Lepry, Tetters, and Cancerous sores.

And in being mixt with Celers or fit plaisters, they do cure deformities of the nails, causing them to fall off. They are used in medicines for Corns on the feet or hands. Some
Some anoint the places where the hair falls off, with Cantharides bruised and liquid Pitch; the skin being prepared with Nitre: they are good for Cauterities but care must be had that they do not ulcerate to deep; then some command to anoint the ulcers, thereby with the gall or dung of Mice mixt with Hellebore and Pepper. Cantharides mixt with quick Lime, cure Botches, as if you should cut them off with a razor. Some use to call a little of them into Medicaments to provoke urine. But there is a great question of it, because they are poison drunk, in respect of the bladder that they afflict with perpetual torment. There is no question but in ointment they may, do good with the juice of Wilde Vine, or with Sheeps or Goats fats. Some of my Masters put only their wings and their feet into Medicaments that go very well, urine. We, faith Galen, are wont to call in the Cantharides whole, and we judge them to the be the, that are found in wheat, and have a yellow girdle running adveiz, their wings to adorn them. L. 3. & l. 11. de simp. fac. also put under them mightily provoke the terms, and put Medicaments for the Dropie, they are a very good antidote against it; as not only Hippocrates and Dioscorides, but Galen, Avicenna, Rhadis, Pliny, and the best writers do repute amongst Physicians. I cannot here prove sufficiently the excellent use of them, with Levia, Salts, and Gum Ammoniac, to divert Catarrhs, to cure the Goe in the feet and hips; by drawing the matter that lies deep from the centre to the superficies. Alfo they are good against the venom of the Salamanders, as Pliny teacheth l. 29. c. 4. Alfo in some cases, and in some compositions, they are good for such as want erection, and do promote venery very much. But as righty mixt and exhibited in due proportions they are good for being alone, and being not rightly mingled and given disorderly, they cause cruel symptoms and sometimes death. When Ann. 1579. I read at Eafa, a certain married man (it was that brazen bearded Apothecary that dwelt in the Apothecaries' shop) he hearing that his stopple was too weak to drive forth his wires chaffily the first night, consulted one of the chief Physicians, who was most famous, that he might have some efficie prevalent Medicament, whereby he might the sooner dispatch his journey. But when it was day-break almost, there followed a continual distension of the yard without any venereal defires, and after that bloody urine, with inflammation of the bladder, and the new married man almoft fainted away, all Antidotes proving nothing a great while. I remember that the same thing happened to a Noble man of Frankfort in my remembrance, whom when an illiterate Physician thought to cure him of the Dropie by giving him Cantharides, one in number inwardly, he killed him with lamentable torments. Have a singular remedy against the weakness of the Genital parts, which when I used it indifferentely, however it did great help to many Noble men, and no hurts, (who generally are more fuidious in venereal matters) yet it did one amongst the relef so much harm, that after venery (which he was too much addicted to) he pifled blood continually, and swounded away frequently; truly unless there had been plentiful of milk at hand, this Firis bird had died and suffered desperately for his Lechery and licentiousness. Thus far for their Phyletical force, now we shall pass to their deadly and ignominious qualities. They are held to be amongst the number of poisons most deadly, not only by reason of their corroding and inflaming, but by reason of a purifying quality they abound with. Their juice entering into the veins either from the flameth, or by the skin, destroys a man like to poison. Therefore Ovid when he wills mischiif to his enemy, lib. Tibi, withes that his parents might give him the juice of Cantharides to drink. Cicerò ad Fec. l. 5. & epist. famili. Casus by the accufation of L. Cahrus is said to have taken Cantharides, and if by that means he was resolved to kill himself. Gel. l. 3. de simp. fac. writ thus: If they be taken inwardly in a very small quantity, mangled with things fitting, they powerfuly move urine, and sometimes corrode the bladder, whereas it manifesteth all things that kill by a cold quality, if they be taken in a small quantity they may nourish the body: but such as kill by purifying (as Cantharides do) not at all; since they are enemies to mans nature. Coffles a Roman Knight, well noted for his familiarity with Venus, when he was sick of a dangerous Tetter, a Physician was sent for by Cales to cure him, who gave him Cantharides to drink, and so killed him. Pliny. Also Cantharides were objected against Cato of Utica (as the same Author faiths. l. 29. c. 4.) as if he had sold poifon by open fale, because he fet them at 6o. Sextertia. But when they are drank too largely, or applied outwardly too long and too deep, they are wont to produce these symptoms. There happens pickling and pain in the bowels; which is extended from the mouth to the secrets, and to the loyns, and humachers, and hypochondres, and they ulcerate the bladder with a painful ulcer, and inflame the yard and the parts adjacent with a vehement Inflammation: then they pifs blood, and after that pieces of flesh. Sometimes there follows a Diarrhoea and Dysentery, swelling and dulnes, and the mind is perverted, and there is nauseating and heaviness, and a frequent desire to make water and go to stool; but almost it is in vain. They taie a taste of Pitch in their mouths: all which symptoms are set down in Dioscorides l. 6. c. 1. Gal. lib. de Ther ia, ad Pifton. c. 4. and l. 3. de Temper. c. 3. and in Rhadis lib. 8. c. 17. To those that are infected and affected, Dioscorides first prescribes frequent vomiting, then frequent Clysters made with Nitre to cleanse the guts; then to preserve the bladder he gives milk inwardly and fleas feed and. And he will have their Clysters made of other matter than at first, namely of Barley water, Marsh-mallowes, white of Eggs, Mulcilage, of Linseed, Rice-water, decoction of Fennel, Hydroiels, fat Broths, Oyl of sweet Almonds, Goose-grease, yolks of Eggs. Alfo he bids to give inwardly Cowes milk that is lowe, Hydroiels, kernels of the Pitch-tree, the great and the
CHAP. 21.

Of lesser living Creatures.

the small, sweet new Wine, Ducks' grease, a decoction with Diurick seeds, (namely the four great cold seeds) and decoction of figs with syrup of Violets. Oyl of Quinces is commended as the certain Therack for this disease. Also oyl of Liffles, and Samian clay. Rhafis after that Clyfters of far Broth are call in, will have incocion made into the yard with Oyl of Rose fs; and the fiek shall be put into a warm bath in a great Var. sit. c. 17. Authors are not agreed in what part the pofton of Cantharides doth lie. Some think it lyeth in he head and fees and others deny that; yet they all agree that the wings are an Antidote in what part forever the pofton lyeth; and tho' being taken off it is deadly; so that this venom hath its remedy joyned with it. Plin. l. 11. 35. Lyrum of Napley writes that Purflain is an Antidote against Cantharides, which Pliny l. 20. c. 13. affirms of white Basil: who alfo l. 23. c. 2, and 4. l. 38. c. 10, commends very much Vinegar of Squils, Oyl of Dill, Cofes Milk, and Broth of Goats Befh. And thus much shall suffice for the History of Cantharides, which I wonder that the molt learned Gefner, and efcpecially Peninus overlift.

CHAP. XXI.

Of Beetles.

The Beetle is an Infeft that may be called unufualnes, as if he had his wings in a feathet.

It is bed of putrid things and of dung, and it chiefly feeds and delights in that. The Greeks call it αὐλοφόρον; the Tyrians, δαμαΣ; the Germans Κατεγραφον; the Italians Efferuavino, Peloter; the French, Efterbof; the Polonians Krewka; the Illyrians Krabak; the English, Beetle, or Bug; the Northern English call it Klock; but the Southern, Starkenbeke; the Arabians Kanafis and Kanafes by Aviörenna. The Greeks all with one consent, hold that all Beetles are males, whereon one may eafily understand the fente of Aufoin his Epigram upon Marcus that was gelled, Rhodinios l. 8. c. 5. Antig. lef. renders it to us. Also the Egyptians caufed a picture of this creature to be made on the statues of their Heroes, intimating thereby their munhood, that had no mixture of feminine weaknes; for men muft be valiant and manly, feminine puflimainity is a great disgrace to them. All Beetles call their skins, and they have no sting; when you touch them they are afraid, and they leave off to move, and they grow hard. Alteru s did vainly attribute to them four wings hid under a claffy cover, for experience fhews but two, very tender and frail, wherefore they have them put up in a hard cover over them, to defend them that they may take no hurt by hard bodies. For the great part of them either dug under ground, or bies rooted wood with their teeth, and makes houfes and nefts there: so that if they were not excellent well guarded, they could never keep themselves safe from external injuries. When they fly they make fueh a humning or noise in the air, that Laerius write the gods talk with men by these creatures. Of all plants they cannot away with Rofe trees, and they hate them as the deituation of their kinds; for they dye by the smell of them (as we read in Geopu) but on the contrary they take great pleafure in flinking and beaftly places.

I remember one was call to cleifie privies, when he came into an Apothecaries shop at Antwerp; and fmeft the fpices, he prefitly fell down in a fwoon, which one of the ftandants oberving, he went and gathered up some horse dung in the ftrees, and put it to his nofe, and to a man used to flinking fmes was recovered by a flinking smell. Therefore it is no wonder if a Beetle (that we faid before was bred and fed with dung) being anointed with oyl of Rogers, he kill'd thereby; they are the words of Clemens Alexandria. 2. Pedag. which alfo Plu tarch elsewhere, and Aelian alfo affirn. They abhorre the fmoke of Alhur, efcpecially of the leaves of Pflamum, Acer, Cow dung, and Nigella feed, Rhafis 88. The Hemerocallis of Di efordices is called by some άµηρόβος; for the great force it hath to kill Beetles: but as they do extremely fhun thofe plants, fo they very much affect to be under its shade, and they naturally delight to go under it, under which when they are gathered in heaps, it is an eafe matter to catch them, for they will hardly go from it. Beetles are some greater, some lefs. The great ones, fome have horns, others are without horns. Thofe that have horns, fome are like Harts horns, others like Goats horns, others have Bufs horns, others have Rams horns: fome have horns in their nothes: we fhall speak of them all in order. The Ιλιναίος, or Harts horn Beetle is called Locomus by Nigidius; as Pliny winnefeth. Some call it the Bull, others the flying Stag: Hellychus call it ιννοβος, because it lies hold on things in its way with thorny fpecies: the Comedian and Englaffhin call it ιννοβος; because it is the greates of all: Car danus calls it ιννοβος, a word commonded of Greek and Latin; Gerae Cals is Ιννοβος, the Italians call it Corcis and vulgarly Palupufa; the French, Cerf volat; the English, Stag-fly; or Flying-fly; the Hollanders, Vlieghende hert; the Illirians, Gerlin; the Poles and Sclavonians Krowba, Vliekls. Amongst all the homed Beetles, for the shape of its body, length and magnitude, it may challenge the first place, and is the molt noted. It is blackfift of a dark red, efcpecially about the outward cover and the breath; it hath two whole horns without joynes, and with brances like a flag as long as ones little finger in such as are grown up, but they are lefs and short.
ter in the young ones; or (as Pliny saith) it hath long
and movable horns nicked with cloven pincers, and
when it will it can bite or nip with them. For it will
close them wonderfully, and with its homes for that
end for which Crabs and Lobsters do their claws.
The eyes are hard, putting forth and whithiff, it hath fore-
yards on both sides of them; one pair that are branched
between the horns & the eyes, the joyn whereof makes
almost a right angle, and two more breaking forth of
the midle of the forehead straight, and plainly ending as
it were in a little smooth knot; it goes upon fix feet,
the fore feet are longer and greater than the rest.

Lonicera makes this to be the male: but I (if there be
any distinction between the male and the female) could
not doubt to call it the female; both because the other
kinds of beetles are lefts (for as Aristotle observes
the males in Insects are far lefts than the female) and also
in copulation the females receive from the lefle, as
experience confirms it. The male is altogether like it,
but 'tis lefts both for body and horns; which though
they be not branched on both sides, yet pretel to
together they do move far sharper prick ones fingers than
the female doth. The third is three or four times lesss
than the former: a black colour, with little cloven horns,
neat to which there are two fore-yards distingiuished
with many joynts. It hath eyes a little standing forth,
and that are great in respe of its body. The shoul-
ders on both sides end in an acute angle. It feeds for
the most part in a clammy far juyce coming forth of the oak; nor is
it easily to be seen but where oakes grow. The fourth kinde is very
rare: it hath two little horns, thrice branched inwardly, they seem
whithiff from black; the back is parted with black and white spots,
but the belly with silver coloured and blew. It goes on six feet, which
are no lesss black than the fore-yards: when the head is cut off, the
other parts of the body live long; but the head (contrary to the usual
custom of Insects) lives longer. This is said to be dedicated to the
Moon, and the head and horns of it wax with the Moon, and do wane
with the Moon, but it is the opinion of vain Astrologers. The horns
are not without their Medicinal venner: for they cure childrens diseases; for hanged about
their necks, if they be great horns and full of branches, they serve for an Amulet. Laid to
fcrophulous humors and the Gout, they help much, especially if they be applied with the earth
they have call up. Pliny. It horned Beetles they call fages, be boyled in wine and the arte-
ries of the arms be adorned with it, it cures Agues. Mirabilis. But I note by the way, that
Gyllerius of shelf fish, was not very wise, who writing a Book of the Nature of things, was quite
out, when he placed that flying Stag amongst the Grasshoppers; sometimes he makes it a Locust,
sometimes a Brachus, sometimes he confounds it with a Glow-worm, conjecturing every way,
but teaching nothing. The Philosopher saith that those Stag-flies are bred only from worms
growing in rotten wood. But I rather approve of it, that they breed from dung as experience
tellifies. Arizones, larizones, argones, xepones; (there are words that are synonamous) in Latine,
Capricornus: the Germans call it Holz-back; the English, Goat-chaffor; in greatnes and colour
it resembles broad-horn, it hath a little broad head, great oxe eyes, almost three fingers
overthwart in length; it hath a forked mouth, gaping and terrible, with two very hard crooked teeth; with these whilest he gnaws the wood, I
speak by experience) it doth perfectly grant aloud like a young pig. May
be this is the reason why Hejchim hath related that they bound to a
tree, will drive away fig-grants. The shoulders of it are curiously wrought
by nature, they seem to be a hilt made of Ebony and polished, it hath
six feet, distinguised with three little knees; but they are very weak
and faint, and altogether unfit for such a burden. These receive help
by two horns that grow above their eyes, and are longer than their
whole bodies, they are flexible with nine or ten joynts; not exactly
round, but are rough like Goats horns, which although it can move
them every way, yet when it flies it holds them only forth directly,
and being wearied with flying, it with the them for feet: for knowing
that his legs are weak, he twists his horns about the branch of a tree,
and so he hangs at eape; as our Breram saw in the Country about
Heidelberg; in that it resembles the Bird of Paradise, which wanting
feet
feet, clings about the boughs with those pendulous nerves, and so being tired with labour, takes its ease. They thrust upon us some German fables, as many as say it flies only, and when it is weary it falls to the earth and presently dies. Those that are flies to tales, render this reason for it: Terambus a Satyrus, did not abtain from quipping of the Muses, whereupon they transformed him into a Beetle called Cerambyx, and that deliberately, to endure a double punishment, for he hath legs weak that he goes lame, and like a thief he hangs on a tree. Autunus Likeatis lib. t. of his Metamorphosis relates the matter in these words: The Muses in anger transformed Terambus because he reproached them; and he was made a Cerambyx that feeds on woods, he is seen upon wood, and he hath crooked teeth, and he always moves his jaws; he is black, and long, having wings on his belly, as the greater Beetles have; he is called the Wood-eater Ox; but in the Fables, Cerambyx. The children catch them to play withal, and they pull off its head and carry its and it flies with the horns like a Harp made of a Tortoise-shell. Which words, while Metastationis strove to put them into English (one otherwise well skill'd in the Greek language) he committed two great errors; first, by taking Cerambyx for a Bird when he called it a Fly; secondly, because he translated it, that the head with the wings are like a Harp, when as the Greek book hath it the horns. But whether this be that kind of Beetle that runs up and down, and makes a noise like a kid in the leaves of Eriphila; (the Wizards say there is no better remedy to cure the voice) truly I am ignorant of it, but I suppose it is the lesser Beetle, because the stalk of Fennel gigantic would scarce contain this when he is grown great. We have seen divers kinds of Cerambyces besides this we now speak of, one that was like to the frit of thefe, but differing in magnitude and colour; the belly thighs and horns were of a watcrish blew; the shoulders, tail and cover wings were varied with some black spots, also the joynes of the horns were black; the hinder legs grew longer than the reft; we received thefe from Quickthorpe, who fent them from a Sower, we have one more that is green without, and underneath dun coloured; the head, shoulders & cover wings are a dark green, and shining alio with gold; it is something a long body, and items like the other, but it is something less; it hath purple horns, but the feet and the legs are of a violet colour. I first gave to Pennins a third that was of like colour to this; it smells almost like Nutmeg and Cinamon. But that (wee fmall) (as good as the oyl of Myrtle) presenty when it dies evaporates into the air, and leaving the body, doth wholly infinate it self in to the box it was kept in. Cardanus makes mention of this Beetle, but I know no man that found it before me. There is yet one of a shinning black, that hath a great belly, thick, with a body and horns shorter than the reft, the joynes of the horns are not round as they are in the reft but lightly saw'd on both fides, Pennins faith he is beholding to Caroli Clusius for it. The fifth is altogether like the frit for head, mouth and teeth, with very black eyes; a brown colour all over the body; a mouth wide open and dented; the head, neck and wings are blefted with very small black spots; the body of it is almost as great as the second Cerambyx; it is but seldom seen, it lives in houfes and dry wood. The fifth is ash-colour with a very little head; they eyes are both white; the horns are somewhat long, jointed, differently bled with white spots; the cover wings, and almost the whole body
is various, it is conversant in bouses, but whether it dwell in wood also I know not. I saw the se-venth brought from Russia by Edward Elmers, it was brownish all the body over, it had round jovyns on the horns 7 or 8; it is easily known by its form. There is an eighth kinde not far differing from this in figure and magnitude, but that the head, shoulers and wings are blewth.

Pachinus Camerarius sent a ninth to Peninus (he was one that deferved singularly of the Common-wealth of learning) the wings and feet were of a fandy colour; the head, the horns and belly were blackish; he had bowed horns made with many tumings and knots, which he turned to both sides in the twinkling of an eye; it creeps upon plants (especially on Cythius) I think the Beetle which Johannes de Chaun describes lib. de varia quercus historiae ch. 26. is of this kinde: There dwells a creature in the oaks, of the kinds of Beetles, (so far as we can conjecture) it is of a blackish colour with long legs, carrying two prickles in his head, a little crooked where- with he lays fast hold of what he meets with. Those Carpenters that have timber of oakes found this little creature alive in the very heat of the oak.

The country people of Lyons call it Thuto: it lives beet and longest in rafts of bouses, and it sometimes comes forth and shews it self making a little noyse in places where flouses are. Geners of pious memory, Epit. I. 3, law such a one, or one like it, voided by an old woman that was sick of a Pleur- reis, his words are thefe: An old woman that was sick of a Pleurefe, voiced a black Beetle downward, after he had drank a Potion of our Oxy-mel with a deception of Eunugreek; it had long feet, horns that were joynted and were flexible; it was full of raw purrefation, and alive: it was as long as two joyntes of ones finger. The tenth is all purple coloured from black; and hath a forked mouth. The eleventh is all black. The twelfth hath horns that are not fo much joynted, the head and shoulers are blew; all the rest of the body seems a bright red. However you fee the horse of all thefe, some straights, others crooked in their pictures, (for to explain them the better) yet for the most part they wear them with a bending of them backward to their shoulers, as goats do, as you fee the fift Cerambyx; and upon that account I think it fit to put them into the fame rank. And thus much for Cerambyx; or Capricorn, and its kinde.

I have learned no other use of them in Phy-licks than that taken in the left hand, they drive away quarrain Aques, Phis. I. 30. cap. 11. It may be poffibility, by better experience will diouver more of their vertues, and will not fiffer themfelves to be perfwaded that a creature God hath made fo curiously can want rare vertues in Me-dicaments, which he hath beftowed on far better things (according to his goodnes unto mankinde) Fitter-mice take this for their chief dainties, and prefer it before Gnats, especially if they can catch them and squeeze them alive.

Bousque or Tangyques, Oxe, or Bulls horns rather, hath alwaies two horns flanding straight and right forth; it is blackish from red, and seems almost without any head; yet it hath a very small head flunk into its short thick shoulers, and a little thorn comes forth of the middle of the forehead, very sharp for defence. We have seen four kinde of Noife-horns, the chiefeft and greatest of all lives in For- dis; it is very black, it hath a note on its face crooked horn'd like to the stem of a flup; about the middle whereof there is another horn bent inward, and comes forth of a little knot, and such another comes out of a banch on the shoulder; the whole body from the end of the horns to the tail is four inches long, and it is about two inches broad. Like to Beetles it hath no female, but it shapes its own form it self. It producteth its young one from the ground by it self, which
Chap. 21. Of lesser living Creatures.

Purs. Camerarius did elegantly express, when he sent to Pennius the shape of this Insect out of the Florchoue of natural things of the Duke of Saxony; with these Verses:

A Bee began me not, nor yet did I proceed
From any Female, but my self I breed.

For it dies once in a year, and from its own corruption, like a Phoenix, it lives again (as Mounius winnseth) by heat of the Sun.

A thousand summers heat and winters cold
When the hath felt and that she hath grow old;
Her life that seems a burden in a tomb
Of spices laid, comes younger in her room.

The seond kinde of Nose-horn very rare and worthy to be seen, sacred to Mercury, Carolus Clusius sent painted from Vienna, where it is very frequent, the form is as you see it: it would seem all pitch colour, but this the belly is a full red; that crooked horn in the nose is so sharp, that (what is said of an Elephant going to battle) you would think it had got an edge by rubbing it against a rock. The third Nose-horn, and fourth seem to be alike, but that the former hath wings growing out longer than the sheath covers, but the others are shorter. You would say they were rub'd with shining ink, they are so perfectly all over black. The Ram or esthous, hath knotty horns, violet colour, a head greenish from gold colour, the shoulders like Vermilion, a purple coloured belly, these wings of the colour of the head, it goes forward with legs and feet, of a light red, but the wings shut up in the sheath, do finely express the small whitish membrane of a Cane.

The greater Beetles without horns are many; namely, that is called Pilularius, and another that is called Melambes; another purple, one again that is dark coloured; one called Atvrons and another Fella. Some call the Pilularius the dunghill Beetle, because it breeds from dung and filth, and also willingly dwells there. The Greeks call it coros, and tnanos, and from its form like a car, ἐπιστείλαμα: the Germans, Roff-kares, Kaas, or Mißkafer; in English, Dung-beetle, Sharndogg; in French, Femelle merce, as you would say Dung-digger; the Latines call it Pilularius, because it turns up round pills from the dung, which it fashions by turning it backwards with its hinder feet. Porphyrie doth thus describe the nature of it: All your Pilularius have no females, but have their generation from the Sun; they make great balls with their hinder feet, and drive them the contrary way, like the Sun in obturates a circuit of 28 daies. Athen faith almost the same. There is no female Beetle, it puts the seed into a round ball of dung, which it rows and heats in 28 daies, and so produceth its young. They would say...
thus much: that the Beetle called *Philaenus* makes a round ball of the roundness of the Heavens, which it turns from East to West to long, till it hath brought it to the figure of the World; afterwards it leaves it up under the earth where it begets, and when that hath to find it up it lets remain there for a Lunar month; when that is ended, it calls every ball out of its nest by itself, which being covered in waxes, the Beetle women comes forth without wings, but in a few days it grows up to be a flying Beetle. For this reason the Egyptians consecrated this to Apollo and adorned it for no small god, by the curious interpretation of όποιος, whereby he collected, that the likenesses of the Sun was given to this creature, and to be excused the idolatrous customs of his Country, *Pliny and Plutarch, Ep. 4*. They would fully here Roes as the plague of their family; but dung, especially of Cowes and daughters, they love to make, and stuffing the smell of them a very great while, they would fly suddenly to it, *Theop. of Smal*.

But they go but slowly, yet they lay their continuall and exceedingly, and delight most of all to produce their young ones: for oft times the little round balls that they make, by the injury of the winds or of the place, fall away, and fall from a high place to the bottom; but this Beetle dehien a propagation, watcheth with perpetual care, and raising this Silphian ball to its hold with continual striving, and that tumbles back again, at length the reduceth it. And truly unles it were endued with a kind of divine soul (as all things are full of Gods wonderfulness) it would faint and bespent in this great contrect, and would never take this pains any more. Some say they die being blinded by the Sun; but the most think they are choked by lice (that creep all about them) they hardly hold out one winter. They chiefly delight in the shade of the Ivy tree, as most heinful for them. *Praxamis in Geopon*. I have let down the form of it so exactly, and in its colours (for it is all black) that I need say no more. Beetles fift breed from dung (faith *I. L. Langius*) as the Worms breed out of rotten wood; then their seed being bred into a round ball, and the same being enlivened, breeds their young ones: every one knows this sufficiently, unless they live where no dung is; for in dunghills they are obvious to every Man.

Beetles serve for divers uses; for they both profit our minds, and they cure some immituities of our bodies. For when this living creature, (and scarce a living creature, for it wants some lentes) being of the bafeft kind of Insects, and nothing but a crust, doth excel man in divers faculties; this should teach us modesty, temperance, labors magnanimity, justice and prudence. For though its house be but a dunghill, yet it lives concerned the earth, and is buried and delighted in it; nor doth this more willingly drink or eat amongst Roes than in Goats dung, which finds in its fenses as sweet as Maccaron. For it lives by the law of Nature, and will not exceed her orders. The greatest care it takes, is to make the greatesst balls it can, as if they were sweet balls, which with wonderful labour it rolles from her: and if she chance to roll its burden against some heap, that the ball slip away and fall down again, you would imagine that you saw *Silphius* rolling a stone to the top of a mountain, and falling back again upon him, yet it is not weary, nor will it rest, till it hath rolled it to its nest, no earnest it is about its work. But we poor men do nothing that is worth our 1 hour, or as we have power to do, and we give off in the very steep entrance of venery, and we spend all our pains and dyes in idleness, following all curiolities, till we get a habit of mitrichet to our own detraction. Who doth not see the courage of the Beetle? if the shall obereve him fighting with an Eagle (as is related of the Beetles in India) I believe that it will come to pass, (as Eratistus said) that some men extremely favouring the Roman Commanders, will lament for the Eagle, that the confederates in upon takingly a Bird to fight with it, that he should be defeated by it, that the greatest flames, and the Beetle will win pride enough that he beborne with an Eagle, though he should be overcome. The Poet say that *Apis* was attemnted of to weak an adversary as *Silphius* was, and valiant Captains diddian to contend with common soldiery. Again, a man would wonder whence this mean *Insect* hath gained so much courage, and boldness, that it dares wage war with the strongest of Birds: also whence it hath means, forces, faculties, and patience, that it can contend so many years with the Eagle, without any recombination. But if any man will unfold this secret, and view this contemptible creature nears, and it were at home, he shall observe so many rare proprieties of it, that when he hath consider all, he will desire to be a Beetle rather than an Eagle: yet that no man may flory: flay me before he knows the matter: First of all, it exceeds the Eagle and men too in this respect, that it yearly renewes its old age, and grows young again. This is so great a matter, that I think all earthly potencies, when they come to that immuable old age, that they must part with all, would rather with Beetles change and cast off their eres, than they would receive a seven fold Crown. Again, what huge courage of the minde is there in so small a body? what an heroicall magnanimity? what a force it hath in batten? that *Homies* fly nothing to the Beetle. It hath not a wit so common, but it was of old reputed for it, and commended in all places. Hence was that Greek prove *Bartocidlosius* more than a Beetle: whereby they acribute to it, a singular and incomparable witcombe. Nor doth that concern me if any man will cavil and say he dwells ill favouredly in an uncomely houfe, for I shall rather juftly condemn their household government, who being ill favoured themselves, and of filthy conditions, do build their houses curiously and loitily with fo great care, and charges of King *Attalus*. Moreover, thar it ueth the excrements of living creatures for its own commodity is no fault, but a commendation of its wit and ingenuity. As though we that are Physicin did not the same things, as often as we apply the blood, the fluxes, the irises, and somet
times the orde and dung of living creatures to our patients, and sometimes we give them in Potions. Nor are Alchymists ashamed (who would be divine men indeed) and not mortals, could they obtain what they aim at) to use dung to draw forth that quincuncia, Nor are husband-men (a lot of people that of old time none were more honoured, none more feared now) ashamed to dung their fields. And it is probable they first learned their Art from the Beetle called Pilularis. For why should it chiefly include its feed in dung, unless God had there that should be in that a great deal of vegetable heat and moisture, whereby principally generation is perfected? Hence it is that wise Farmers dung'd their fields to make them more fruitful and to conquer that horrid leanness, barrenness and poverty of their grounds. But you will say that the Beetles Pilularis like the smell of all flinking a thing. It were a folly to look for a man noise in a Beetle, for that is peculiar to man to be displeased with the scent of his own dung; and is it not with any other creatures; therefore the Beetle is more happy than we, but not more unequally: yet men are not so much offended with it, as it is, but as they conceive of it. For of old time it did not seem abominable to them as it doth to us; for they called it by a lucky word, Letames and they thought it to call Saturn the dunghill god; for his honour, if we will believe Marcellus. For Pliny faith that Stelarcus the son of Panus got not only the name, but also immortality by it in Italy. Moreover the same thing in Greece procured to two Kings great glory; to Aegus who invented it, and Hercules that spread it abroad. Lastly the memory of that old King will never be abolished, whom Homer (as Cicero in Fane commended) commended to posterity for dunging the ground with his hands, and to no other thing, but that the Beetle is delighted in. A Roman Emperor was nothing offended with the smell of urine, if it brought profit with it. Wherefore then should we be offended with the Pilularis, who hath so many good properties, for one small inconvenience? If we call that an inconvenience that is most commodious for the forthing of its young. Lastly, when we see the Beetles, though in the dungs alwayes clean, and his shell alwayes near; compare him with men polluted and infected with flies and bawdy houses; and I shall ask which of the two is more clean? And I think it had its name Vide from kingly, pure and clean. If any man thinks their guts to be trivial and vulgar, yet no man but will think that a magnificent thing, and worthy of great honour; that of old time the Beetle was the chiefe amongst their faced images and mysteries of their Soothsayers. It is the most apt Ensign of a famous warrior. For (as Plutarch reports in his Comment of Isis and Osiris) in the hieroglyphical pictures of the Egyptians an Eye was the Emblem of a King, a Scepter being added to it, for it signified a right and judicious administration of things. But he faith, that Thokos their Images that wanted hands, those represented Judges, who ought to be free from bribes; and amongst these there was one also that wanted his eyes, which represented the chief Judge, because he ought to be free from all pitties, and to look on the business, and to hear or respect no mans person. It was not Pimpernel amongst pot-herbs (as the proverb is) but a Beetle ingra- ved in a Seal amongst the faced Images. And what did those wise Theologians intimate to us thereby? no common thing indeed, but a valiant and invincible Captain. For Plutarch faith as much, that no man may foppete that I invented it; as your common Theologians use to invent Allegories. But some ignorant fellow may say, what hath a Beetle to compare with a Com- mander in an Army? Truly they agree in many things. First you see the Beetle is all in armour, and there is no part of its body but is guarded with plates and harness, that Mary in Homer cannot be said to be better armed when he is in complex armour, and fenced cap-a-pie. Add to this his warlike march with a horrid and terrible humming; what is there more unpleasant than the sounding of Trumpets? what more loath'd than the bearing of Drums? for the founding of Trumpets that Kings now to much delight in; the Bursides could not endure, because it seemed like to the braying of an Ass, and the Ass was held abominable amongst them. Add hereto into the wonderful patience of the Beetle in driving on its burden, its invincible courage and contempt of life. To this, men say there is no females amongst Beetles, but they are all males. What can better become a valiant General than to have no female in his camp himselfs nor allow others to have them? Moreover this is fit for the matter, that in those delicate bals we speak of, they exclude their young ones, fodor, cherith, and bring them up, and they have no other place to breed in than they have to feed in. But this secret is not easily for me to open; Son简历's in war can better do it, who know how to lie in their armours or on the bare ground, that in a fierce have undergone hard winters and harder hunger; that have fulfilled their sad life nor with roots of herbs, but with filthy food, who have for some moneths lived in want at sea. If any man consider the beellines of these mens conditions, the Beetle will be a cleanly creature; and consider but their miseryes, and you will think the Beetle happy; yet this is the fo and condition of Generals that no man may despise it. But by the way, I wonder what ails our great men that hold all their Nobility to lie in their Scarchron, that they had rather have Libards, Lions, Dogs, Dragons, Wolves or any other creature that they choose to meet withal, when as their proper symboles is the Beetle both as the figue, and was so used and approved from earliest times, which is the only parent of Nobility? As for the form of its body (let go only prophetical judgement and opinion) and there is no reason why the Beetle Pilularis should be despised, or can be; for if Philosophers fay true, that a spherial figure is the most comely and the belt, why then shall not the Beetle seem comely, which from the judgement of Dem- argus is nearer to it than an Eagle or a man himself? Clem. Alexandr. 1. 5. str. 1. And though

Rrrr 2
The Beetle have a face like a Cat, a creature familiar with us, and more useful, than it is desired for its felt, yet in that respect the Egyptians adore it, and prefer it before all other Insects by many degrees. Calacatumus. Lately, it is horridly beautiful in his kind, and a dog in his, why should not the Beetle be so in its kind? unless we measure the forms of all things by our own, what is not like us must be held to be ugly. No man of a found mind will find fault with the colour of it, for it is forth some jewels, and in special the Diamond that is the chief-felt jewel. Lately, no man will think the Beetle at all delpicable, who shall consider with himself, that Magicians and Physicians fetch remedies from this creature for the greatest diseases; for they are not only carried in men's purifies, but also hang'd about their necks, and offittes that up in gold against all children diseases. What will you say in the most effectual and incredible remedies almost, (for Pliny is the Author of it) with equal force with Antidotes? for that terrible Beetle engraven on an emerald, yeilds a present remedy against all witchcrafts, and no leis effectual than that of which Mercury once gave Ulysses. Nor is it good only against there, but it is also very useful, if any one be about to go before the King upon an occasion: so that such a ring ought especially to be worn by them that intend to beg of Noblemen some jolly preferment, or some rich Province. It keeps away likewise the head-ach, which is no infmall mischief, especially to great drinkers. Who then can despise the Beetle, whose very image engraven upon stones hath so great value? The mentioning of precious stones puts men in mind of adding this also: that if the Eagle delight in the precious stone of her name, the Attires; the Beetle comes not behind her in its share of the same honour, for the Stone Canthar. also owes its name to it, wonderfully resembling the whole figure of the creature, to that on we should say it is not the shape represent'd, but a living and true Beetle incloset in the stone. Moreover this impure and filthy creature (fortoorth) boyled with worms in oyf of Roes, doth very well cure the pains of the ears. Plin. Attines prescribes the Beetles called Bilubarias being flamed alone, to be boyled without worms, which the Author of the Book ad Pifonom, approves also, chap. 12. Syntacinius chap. 94. writes thus out of Attines: The Dung-Scarbates help the pains of the womb, they provoke urine and monytermous, they procure Abortion; with Cordumen: they are good to heal the Harmorrhoids, and they help that benemmunition which comes of venomes infixed by living creatures; and the oyf in which they are bruited takes away the pains of the ears. The later writers commend these Beetles dried among the remedies for the Stone: especially Alexander. Benedic. Laurenzicus makes for the cure of the Stone this kind of powder, which is no ordinary one: Bun the Dung-beetle or any other after the same manner as you do Grasphoppers, or Scorpiions; Take of the ashes of them grains v. of Hippocrates j. dram, of Pigeons dung j. dram and a half, let them be dried and a powder made of them. The Dope is j. dram with water of the decoction of Radish, Brabham, or black Chiches. For the Harmorrhoids this ointment is very much commended. Take of oynment Populeum j. ounce, of oyf of Roes in which 20 Beetles and as many Chilleps have boyled a good while j. ounce and half of Siffon gr. iiiij. let them incorporate and be made into an oynment. Arnol. de villa nova Briqiar. l. i. c. 25. reports that he had gotten of his matter a singular oynment against the Convulsion, made of Beetles after this manner: Take of Pepper, Euphorbium, Pellitory of Spain; each a little, of Beetles to the weight of all the rest; let them all, being brought to a powder and mixt together in a bath with juice of Spear-wort as much as sufficient, be macerated and made in the fashion of an oynment, with which let the pulses of the armies, feet and temples, with the navel and back-bone, be anointed. Moreover, f. 4. c. 11. he prescribes for the awakening of such as are troubled with the Dead sleep, and with the Lethargy (when Cantharides and Caueries have done good) two or three Dung-beetles alive put up together under half a waltteri, to be made fall about the nape of the neck, being first well swathed and after the muscles of the forepart of the arms (on every muscle one) and under the sole of each foot one, because this doth wonderfully rouze up such as are in a Lethargy. And Mr. John of Florence (Sir Ambrose) awakened one that had been held with a Lethargy for seven days, with this remedy, having tried all others in vain, and cured him afterward with Cantharies laid upon the nape of his neck to bluster it. The Dung-Beetles are best for this purpose, they are next which use to be found under stones, and then those which are found in a bath. The Solar Beetle cures them who are sick of a Quaran Ague, Sir John Allen. Pliny and Traulium shew us the way of using it; which is, when it is hung about the neck alive, and wap't up in a piece of red cloth, and this they testifie they have seen confirmed by many experiments. Yet the Magicians will scarce finde credit, when foolishly rather than truly, they report and imagine that the precious stone Chelomitaris which is adorned with golden spots, put into hot water with a Beetle, raitheth tempefts. Plin. l. 37. c. 10. If nothing of the Eagle, the Woodcock, the birds called Lani by Gesner, in whose nests Beetles stuck upon thomes (which our Brnerus first observ'd) are an argument, that they serve for this use also, to feed Birds. Nay Bellonius affirms that many other living creatures, especially Frogs that are in Marsh grounds, feed upon them. And indeed though the Eagle's proud and cruel enemy, do no less make havoc of and devour this creature of so mean a rank, than our lordly Storks use to do the peasant Frogs; yet as soon as it gets an opportunity, it returneth like for like, and sufficiently punishteth that spoiler. For it flyeth up nimblly into her nest with its fellow-foudlers the Scar-a-beetles, and in the absence of the old the Eagle bringeth out of the nest the Eagles eggs one after another, till there be none left, which falling
ling and being broken; the young ones while they are yet unihapen, being daft mutually against the stones, are deprived of life, before they have any sense of it. Neither do I see indeed how the should more torment the Eagle than in her young ones. For some who flight the greatest torments of their own body, cannot endure the least torments of their foes. We see Affes, (those flagellant and almost senseless creatures) run to the help of their foes through fire, if it be in their way, with a strange contempt of their life. So that I cannot but admire and magnifie the Beetles ingred widome in the choice of its revenge. But enough of this, lest I should seem to have made (not an Elephant of a fly, but) a Gyan of a Beetle. I will contenst indeed, that as I was loath to make a great volume about a small thing, so I accounted it a sin to bury in flence what I had read. I wonder at Pennin's brevity and empricins in this argument, since in Lucian, Pliny, Homer, Aristophanes Theorvirm, Alexandrinus, Erasmus, and infinite other Authors, wonderful things are recorded of the Dung-Beetle, well worth our mentioning.

There is another altogether like the Dung-Beetle, but of a darkish bright blew colour, with a notable shning. This in the moneth Angulf is troubled with lice hanging between its legs, and at lait kill'd with them. I should rather take this for the cat-fashoned Beetles, because an egge is not more like to an egge, than this is to a cat. It is met with everywhere, but I have more often seen it about Colchester. Let us go forward,

That which I should call the Emerald coloured or greenih Beetle, the Greek comick Poets all of them call μαραθόν, the Attick μαραθόν and Κρυλλία. Eusith, Some likewise call it Κρυλλίανιαν and Κρυλλινιος, but without right. It is taken by some for the Tree-Beetle, but its place tells us it is a nutlaker. The Ruthicks in Lombardy call them Gallusacius, as much as to say, French Palmerworms (as Niphos interprets it) though yet they agree in nothing with Palmer-worms. In Dutch it is called Greven-Odor, Gehuwdeker; in Italian, Mariola; in Polonian, Zielonakorka; in English, Greenesher. The opinions of writers are divers about this little creature; both because this kind of Beetle is not every where easy to be found, as it seemeth to be very near the Cantharins. Some have it to be the Cantharinae, but for the most part there is wanting in it that cautlck virtue. The Scholast upon Aristophanes calleth it Καθαρις γαλαξία, a little creature of the colour of gold like a Beetle. Eusithins calls it a great Wapf, Pollux affirms it to be a little creature which flies, but sets not down its kind. Gata translates it Gallusacius but it hath nothing like it; and they who contend that it is a Tree-Beetle, have either left their eyes, or either cannot distinguish varieties of colours. Hefchius makes it a Beetle, but of a golden colour: as the Scholast upon Aristophanes, yellow: Later writers call it the greenih or Emerald coloured Beetle, but shning as it were with gold. Marcellus Empiricus intimates as much in these words: the green Scarabee (the Greeks call it μαραθόν) is of a lively emerald colour, by reason of the pleasanterit, whereas, it is so delightful and benefatical to the eyes, that they can never be weary of it; for the longer you look upon it, the more you would be in love with it. Pliny also faith the same. l. 30. c. 70. & c. 9. The male is green all over, except the eyes which are tuddy: the feathers of the males wings (which is the biger) seem to be of a cheynr colour, shning with a delightlome and beautifull shnitcnes: otherwise it is like the male. The brot of them both standts out with a sharp point, which I have not observed in other Beetles. P. Quickeberg in an Apothecary of Anwors, but one who was to be preferred before many Physicians for his studiousness about things natural, lent to Pennin a male and female of them, painted as it were with Apollo's hand. Aristof. l. 9. de Respirationis, attribut to it a thrill found, which perhaps gave occasion to some to call this the Tree-Beetle. They are generated (faith the Philosopher) in Κεννακον, Νεφελων, Μαραθών, Λεύκων, δε Ζωον, ζωον, that is, of worms which are in cour- dung, and of self-dung. But Stephanus out of Theophrastus faith otherwise, γόργιον καθαρις ον τοι Κρυλλίανιαν, Νεφελων, Λεύκων, Καθαρις, Περικοιαν, Καθαρις, Ωροις, Ωροις. The Melonthe is bred of the blossoms of Apple-trees or at least it flies to them when they begin to blsse. We are beholding to Charles Claxton for another kind of this Beetle, whose feet are black, as like- wise its head and shoulders, but from belowth. It hath horns in appearance, but not so indeed (wherefore we reckon it amongst the Καθαρις, or hornless Beetle) its sheth wings seem to be furrowed: but about the edge they are some-what red. Theslomus tells us of another notable kind of Melonthe (and I have here represented to you the figure of it), in these words: it is green all over, except the eyes (for those are exceeding black); its belly from golden is a little red, and its thighs; the middle of its
The Theater of Insects: or, Book 1.

back is beautified with a half Moon of the same colour with its sheath wings; for which reason it is elegantly called by the Latins, Equus Luna; the Moons Horse. Thistleau writes that Aristotle makes mention of this, but I cannot yet finde where the Philosopher does it. Thistleau while he speaks of this among the Dung-Beetles (for which reason also I have added it to them) describeth it thus in verse:

Whichs rolling beds of dung this potter frame,
Some blacks like the fcorch'd Moor are seen,
The nobler sort are deckt with green;
Whose back both (to compare great things with small)
A mark you may the half Moon call.
The English call't the Moons horse, fo renown'ds
But had there e're fo fair been founds
Many a Semiramis would love us then,
And Centaures had their numbred men.

And indeed most of the Beetles are hideously black; yet I make no question, but some of them have their case shining with a blacker others with a more pleasanfe green. These are also that shine like gold, and those very great ones, which dig up the earth, and make their nefts there. Some there are which fly about with a little humming; some with a terrible & with a formidable noise, so that they would not a little frighten one that is not aware of them. There are other differences also of shapes amongst them: but their breeding in dung, their feeding, lie, and delight in the same, this is common to them all. Another Beetle of a purple colour was brought to us from Constantinople, which (only that its eyes, belly, and feet were like pitch) was all over of a purple and violet colour. The black one, which lives in dry wood, is formed after this manner: It is all over black, or ruflet rather, as if it were clad in mourning; its mouth is forked, its shoulders almost square, its legs and homs somewhat short; it felde flies, but goes for the most part, and murmurs while it is going, as lewd servants use to do. The Tree-Beetle is very common, and every where to be met with especially in the moneths of July and August, after Sun-fer: for then it flyeth giddily in mens faces with a great humming and loud noise, and vexeth carrel. Thefe Beetles spoil the leaves of trees, which they do not so much eat as tear in pieces out of an inbred malice; for they feed upon gnos. We call them Dorry in English; the Dutchmen, Bawnekfer, Loubkfer; Fr. Agricola l. de Sibieten, Anim. Senkfer; the Frenchans Hametons. The feathers of their wings are of a light red colour, and covered as it were with a very line flower, otherwise they flame but a little; their legs, feet, and prickly tail are of the fame colour: its other parts are all over brown; only that the circle about their eyes, and their little horns are yellowish, and of the fame colour are they a little above the beginning of their tail; the joynts of their bellies are whitish. In Normandy they are much more numerous every third year and therefore they call it L' au des hametons. It is recorded in our Chronicles, that in the year of our Lord 1574, on the 24. of February there fell such a multitude of them into the River Severn, that they loppt and clog'd the wheels of the Water-mills: and indeed, unles together with the industry of men, the Hens, Ducks, Goat-milkers, Catsells, Bats, and other Birds of prey (which seem to make these their dainties) had afforded their help, the Mills had even to this day been choked with them and stood still.

There is another taken to be of kinto this, of a colour all over between brown white, its belly gray and as it were hoary. Of what use it is in Phyfick I confefs I know not. Fowlers indeed when they hunt for Ducks, bait their hook with two or three Dors or Tree Beetles, and ye a heavey stone to their line, which they cover with flags, that their wifes be not discovered: the Dusk for greediness of meat pretendly swallowes the hook, which sticking fast she is punished for her folly. How Cranes are taken with these wrapped up in a goard, he that hath a mind to know may read Gepfer de Gru.

The Beetle which Pliny calls Falsa is more rare, and not everywhere to be met with. It is not any where to be seen here in England, so far as I have heard or read,
read, Gaza sometimes translated that which Aristotle calls *Cerastes* Fullo, whereas he always intended that the Dung-Beetle only should be known by that name, and he gave proper appellations to all the rest. Neither can the Fuller-Beetle be called the red Beetle (as Frugiurus contrahit) nor is it a creature with a forked tail, which Hadrian *feminis* puts upon us for that *Fullo*; for the forked tail is not of the sheath-wing'd kind, as it still appear more at large in the history thereof. This Beetle certainly is a fair one, bigger than the Tree-Beetle, but somewhat less than the female flying Hart: it hath a head almost horny, beautified with two little horns; its eyes and hairy breast are of a yellowish white; it hath feet coal-black; its belly and tail are like to Cranes feathers; its shoulders and wings are so beautifully wrought with black and white specks, that you would easily swear it were a cloathing of Damask embroidered after the Phrygian manner. Magicians say, that this Insect is a singular remedy against Quartan Agues, being bound to each arm, if we may believe Pliny l. 30. c. 11. *Pennis* first had the picture of it from Carolus Closius; but *Quickquellbergius* afterward sent him over the creature itself.

CHAP. XXII.

Of the lesser Beetles.

All the lesser Beetles are either spotted in their body, or unspotted: the Greeks call those *Asceius*, divers coloured; and these *Paréotis*, of one colour. The spots of some of them are of a black colour inclining to white, others of them are yellow, others red. Of those that are white from black there are seven kinds, of the yellow ones thirteen, of the red ones twelve; which we have here ranked every one in its several order.

Those that are unspotted, are observed to be all over of the same colour: and of them we have seen six blackish ones; two of a bright bay, one round, one of a ski colour inclining to black, another between yellow and black. And one was very lately observed by us painted with a light red, another seem'd drencht in the juice of the purple fis. We have five which are as yellow as gold, very little ones indeed, but coloured
The Book

of the Oyl-Beetle, and the Water-Beetle.

It is called Proscarabæus in Latin; in Paracelsus, Molius; Agricola, Pingoiculus; from the
fat sweate like honey which plentifully drops from it. The Greeks call it Paragogus and
Dromophyes; it is called by the Germans from the month which it is seen in for the most part,
Mayen Wermlein and Mayen Kafer. Those of Heidelberg have put upon it the name of Schmalz
voghel, those of Dirhmaria, the names of Exer and Kadden Viscus tellus in his Book de
Morb. incogn. in English it may fitly be called the Oylbeetle, or the Oyl-clock. But why it is
rather called Proscarabæus than Scarabæus, contrary to the
intention of Gynus and Peninus. I could allledge many rea-
sons, but this especially, that they are distinguished in sex,
and that they couple together. You see here the bignefs
of the female, and you perceive that it is bigger than the
male, and for the most part of a divers shape; for its
mouth is not at all forked as the females is; this also upon
the lightest motion or touch, runs with an oyl, (like liquid
honey) the male is alwaies observed to be as it were dry.
They couple, as we have often seen it in Heidelberg
fields, tail to tail; the female in the act drawing to it the male
(after the fashion of dogs) so that it is forced to creep
backwards; they have both tender bodies, betwixt black
dark blue shining; upon whose shoulders these grow
two wings, or rather beginnings of wings, as upon the
Eltrich, to help the swiftness not so much of its flying, as
of its going; those circles that compas the belly and the
back, appear green in the young ones, in those that are
more grown, blew rather. If they be bruised, they yeeld
a most pleasant smell, as Taxites affirms in his Nomencl.
it feeds especially upon violet leaves, else upon the leaves of
tender young grubs. They are seldom seen but in the month
of May; all the rest of the year they keep their holes, or
having first wrapped up their feed in round bals of dung, they
die. At Heidelberg and Francford we have seen many of
them in the fields in the paethe grounds, among the corn,
and even in the very gardens and streets. But I have
found none yet in England alive and bred there. Only Agricola hath made them four-footed,
whereas indeed they are all six footed, upon the mitake perhaps, or chance of having met with an
Oyl-beetle, which had had two of its feet pull'd off. Wierum's Oyl-beetle, if you see it tie upon
its back, seems (unless this old man makes sport only) to be made after the figure of a man's
face. It hath gotten longer wings than the rest, and is marked with more rings or girdles going
round its body; otherwise it differs not from that spoken of before. The most noble Knight

1016

The Theater of Insects: or, Book I.

coloured all over with glittering gold, which, left we should
seem to have envied our posterity (the knowledge of) we have
called to be cut and described here. But for what use every
one of them serveth, was declared when we spake in general
of Beetles.
Of lesser living Creatures.

Sir Edmund Knave affirmeth that he saw in England the former kinds of this Oyl-beetle, and sent us the picture of it; but could never finde that oily humour which the German one is full of. It comes short of this likewise in all its dimensions, either because it hath a claramer, or because it hath a foil leaf fit for growth. John Wierus writes thus of the use they serve for: In Dithmaris towards the south they hang the May-worm (for so he calls the Oyl-beetles) about the neck with a thread, especially in the month of May, when that moisture like hony (which is taken to be venomous) drops from it most plentifully: this Beetle (or sometimes two or three) being dryed and beaten into powder they give with beer, puts the sick person into a sudden and great sweat either with labour, or with many coverles upon the bed, or in a stove or oven after the bread is drawn. They upon follow grievous symptoms, as a pain of the heart, an overthrow of all strength, a weakness of the whole body, which for the most part last no longer than half a day: this they repeat every other day, or every third day (as the case requirith) untill the ninth. This drunk they call Anticanthariniun or Kaddensrank, because it is made of Oyl-beetles. And truly for that epidemical head-ach (which Placentius at the end of his Chirurgery, and Borpatia cap.de Vapors, and perhaps Avicen. 4.1. 3. Tex. Tr. 2. e. 9, do define) it is said to be an excellent remedy. The Saxons call this efficace Efieras or Kadden. Paracetum l. 3. c. 6. de morbe. Tartar, recordeth that he cured a Dropie by a medicine compounded of those Meloes and Radith feed: the making of it is after this manner: Take of Beetles called Meloes ten duns, Radith feed one ounce, make a liquor of it: the Dose may be from one ounce to three ounces, if necessity require. He used also Oppidan Melum against head worms, like vit. long. c. 12, which after other medicines he prescribed to be applied for the space of twelve hours. If they be taken before the rising of the Sun, and distilled (faies Agriculta) they are very good for swellings under the eyes, if the places affected be washed every day three or four times.

That oily fatness also health the chaps of those about Heidelberg, who have more than once commended their wonderful vertues to us. They do strangely expell urine, but withal, blood. They close up veins, and nerves, and wounds; they thoroughly cure horse's galls and bruises in the back which come by the badness of faddles.

Galfrinus Reglerus l. de Pestes, adviseth to gather up twenty Oyl-beetles, yet not with your hands, but with two little twigs: then being put into an earthen pot or glasse, let them be mordered in as much of the sweetest Oyl-Olive as will suffice, and keep for use. He affirms that by being anointed with this Oyl Sore in the Groyns, Carbuncles, Petullentiel Sore of Boysles, and wounds made by a mad Dog are cured. In another place he prescribeth that we should draw a circle about the fore with a Siphir Iones, and then anoint the place with the oyl of Meloes, or of Juniper, as being that whatsoever the venome is wonderfully drawn out, and the part affected presently reduced to its natural temper. Marcellus Empiricus mentioneth a certain hairy Beetle of the colour of a Lion, and like one indeed in all things else but his roughnes. He contends that it is called by its proper name Callio; it is found in old hedges, and ungarished ditches and banks: this he writeth is wonderful good for scabby eyes, and eye-lids which have been long fretted with a falt and sharp humour, or eaten away with lice. Thus he fleuther the way of using it: first gather betimes in the morning a colewort leaf wet with the dew of the night, and wrap it up so that all the dew run together to the bottomle of the leaf, then having take up his hairy Beetle with your fore-fingers and thumb, put it up instantly within the leaf; that its urine (which it pretently makes upon its being bruised) may be mingled with the dew of it; for otherwises its pifs in which all the secret lieth will be lost.

If with a probe you shall search the eye-lids, and anoint the places, which are scabby and eaten away, with its dew when it is now impregnated as it were with the piffe of this Beetle, you will confes its strange and wonderful vertues. But what kind of what manner of Beetle this is, I am altogether ignorant, nor can I call to minde any other Authors who have made any mention of it.

The Water-clocks do now challenge to have some room allowed them, which the Greeks' call aetherides the Germans, waffer-kaffers; the English, Water-clocks. All these have their bellies coloured with a light red, and their backs coal-black, except that in England, in whole picture if you darken over all that border which compasseth about its shoulders and its whole oval body, and make its eyes of a silver colour, you cannot define more toward its description. They have every one six feel, the hinder feet exceeding the others in length and bignes, which they use as it were for oars when they swim; under their shelly wings which are very black,
Lye hid their membranous wings at a silver hew, with which by night, having left the water, they nimbly fly through the air, which by day they very seldom or never use. But the least of all are those, which with a restless motion run about in a multitude this way and that way upon the surface of the water without order, and play as it were together, and when the water is troubled, either they dive down to the bottom, or hide themselves in holes of the banks: but afterward, as soon as the waves are still and calm, they leap about it again for joy. *Christophorus Linsternus* writeth to *Gefaur* that he found a Beetle in a certain place, with a leathery crust (as they use to have) which had a head like an Ant somewher yellow, and many wings on the hinder part of the belly it had fins, such as are upon Craps: thus, which they used as they wand ed up and down (like rowers upon the water) it had a little tail flicking out for its defence, but which was parted into very long hairs, being thrown out of pond water into fountain water, it died within a few daies. And thus much of Beetles: which of countreys only *Olympos* of plants only the wilde Lillys produce not: whereupon which is called by *Pliny, Theopompos* and *Antigens, Cantharides*: this by *Discolides Anticantharos*.

**Chap. XXIV.**

Of the Fen-Kricket, the Eve-churre, or the Chur-worm.

Give me leave here where names are wanting to make some. The creature which we have described is that which *Cordus* calleth *Spondylus*: *Dedonius, Buprestes*, both of them amis & without reason. For the *Spondylus* no wings you see this, insect is winged. The *Spondylus* is said by all to be like the *Cantharides*: but this creature neither in figure nor colour nor biggest, overturneth any thing near it; to say nothing of its having no leathery wings, which all wise men will grant the Cantharides have. [If we may make names, we may call it *Gryllodes, a Mole-kricket*] a Kricket because it makes the most thrill noyse which a Kricket doth towards midnight, a *Mole*, because it diggs the earth continually; the Nethelandes call it *Weelmel*. It is an insect ugly to fight and monstrous, four times bigger than the biggest of the Cantharides: especially when it is pretty well grown. The shape you fee before you: I will tell you the colours. The female is paler, the male of a deep brown; that hath besides 2 long ho ws, 4 knobs hanging out as it were of it nostrils and lips; it hath also bigger eyes, and the root of its wings is bedecked with a red spot. But the male is without those buttons, and in stead of them hath two bistles twice as long

as those buttons; it seemeth to be of the same colour all over, and without any spot; both their claws are as black as a Raven; with their fore-feet which are very strong and bending inward they both dig through hillocks, and make holes under ground: they stand upon their middle feet, and with their hinder feet, when need is, they leap; their tail is fork'd, their wings longer than their body, and membranous; their body variously jointed. The young ones for the most part are all over black; the old ones seem to be without hair; it liveth the greatest part of its age under a smooth and moist ground, yet in the night it cometh abroad. It is a very low-paced creature, and its flying is like leaping; whereupon it is reckoned by some among Locusts. It begins to come forth as Krickets do when the Sun is going down, and pleaseth itself with its singing, which is loud enough and may be heard above a mile off; which as soon as the husbandmen hear, they are glad at it: as though they knew by its coming, that the earth now seemed with moistness, and were brought as it were to maturity by the heat of the Sun. It gathereth together grains of wheat, barley, and oats, and carrieth them into its nest being to live upon them perhaps in the winter. Some affirm that it feeds upon Horrie-dung. *Dedonius* relates that this little creature killeth cattle with its biting; falling into this mistake, because he took it to be the *Buprestis*. Whether it do any hurt being taken inwards I know not: but *Pennins* hath often handled it in his bare hands, and without harm, never observing in it any inclination to bite. Our *Brauer* signified as much to *Pennins* who hired Countreymen with his money to observe as often as might be its condition, and to make relation of it.
CHAP. XXV.

Of the Fire-fly.

That which is called by Ἀλίκος ἀποικίσως, other Greeks call μεγάρας, Ἑρμολος μεγάρας, some θροικος μεγάρας. By the latter, they mean those little creatures not proper names, but signify that which is not to be named; which Gaes tranlationeth Bestiales fornacum, Furnace creatures. Strabo reckons them among Gnats, they are called μεγαρας, by Snidas, and by the Sequicymi, as we read in Lactantius 1. 9. Solinus calleth it Carphilsus l. de mund. Mirab. Jul. Scaliger, Ignatia: Gaes, Furnarum, and Bestiis Fornecum, or Ariflois, which he maketh bigger than the greater flies and winged: Pliny affirmed the fame l. 11. c. 36. Antiquit. l. 11. 10. meghas, faith from Ariflois that these Fire-flies are bigger than Mice (not Flies only); where it is evident he fouly misseth μωρον for μωρυν, Mice for Flies; which Xiander his Transtlator took no notice of. In shape it is somewhat like a very big Gnat, of a bright fire-red colour, glittering with a kind of fiery rays; it leaps, goes, flies, and lives in the flames, as Ariflois reporteth, l. 5. hist. c. 19. For I can scarce give credit to Ἀλίκος l. 2. hist. c. 2. when he saith that the Fire-fly as soon as it hath come out of the place where it was bred, and flown into the air for food, dieth presently: for I cannot believe that any thing bred in the fire, goeth out of its element to seek for food; nor is it likely that Nature, that most loving parent of all things, should prescribe any creature such a way of getting its food, by which it should presently lose its life. Neither is it, as it seems to me, so hard to judge of the reason of this, the sudden dying in the air (which Ἀλίκος leaves to be searched out by others) for being bred in the extremity of heat, how should they live in a temperate place? For it is evident by daily experiment, that some Flies dye as soon as ever they are taken up out of the water into the air; much les can those creatures that are bred in the fire, endure the air, since it differeth so much from the air, and indeed more than from the water into the air. These Flies are bred in the Brats of Furnaces of the Isle Cyprus, where the Charitos (or Brat-s-) flame is burnt for many days together: perhaps the sooty vapours which goe up with the flame, while the flone is continually burnt, are the matter and cause of their generation. Strabo speaking in his 12 Book of Works bred in the soves, addeth this which followeth: θαλές άνων δέ βίον των τόνων φάγησιν, θώρακας εέαν έν πεντε χρόνοις πολύς εέαν, ή santa: They conclude that the generation of those creatures is like that of Gnats, of the flame from metals and plates of brass: where any man may see the error of the Interpreter, for he rendereth it thus: Αριστο n. animalium generationem salmum putat ut culicem ex flammea & braueta metallica. For they are bred in the flame (as Scaliger saith) not in sassa, as (I interpret it) in the fire which is condemned together: nor doth any thing forbid but that the most dry animals may be generated in the most dry element (for there is mixture there) as the most ift about the most ift; for we have no pure fire with us. But what hindereth but that living creatures may be generated of matter ready for them, or what natural reason contradiceth it? They answer, that fire devoureth all things, comprehath all things. But they which have had but any taste of the secrets of Philosophy, do evince that to be false by clear demonstration and experience. For so far is our fire from destroying or consuming all things, that it even perfecteth some. It doth not corrupt nor consume gold, nor some sorts of metals, nor all, nor the stone Amiantus, which is very like Seel Alum; nor some other things which I will now stand to reckon up for those Coral men sakes. What then should hinder fire from having the power of generative, so it be in a fit and convenient matter? Its very dinnes cannot hinder the generation from coming to effect; because it proceedeth from the same; but fire is the matter and the forms instrument for some operations. Besides, our fire hath alwayes some moisture joynd with it; for it would not take flame nor burn, if it were not furnishd with a fat moisture; for certainly those things are neither without earth nor water, which are generated in our terrestrial fire, G. Agricola. But if it were not so, because fire prieves not; yet there is no reason we should doubt but that generation may be effected by the fire, as by the form in p. oper metrite. For unless there were moisture in metals they would not melt; what therefore should hinder nature, but that it may give this a form? Aristotele maketh the question. Whether in the sphere of the fire (which is next to the Moon) there be generated any living creatures? and he seemeth to be in doubt, and questioneth the question another time; but when he affirmed that the Fire-fly is generated in this fire of ours, I see no reason why any should doubt of it; yet there are some very learned men, and eminent writers of our time (who seem nevertheless to excel rather in this reading and Language, than in the solid knowledge of things natural) who confess and reject not only the generation of these little creatures in the fire, but this whole history as frivolous, false, and unworthy of a Philosopher. My readers expect now, that I answer their mean arguments.

They object that Aristotele doth in plain terms affirm, that the fire produceth no living creature. The Philosopher doth there compare the heat of feed with the heat of fire, affirming that the is not a very heat in feed; for (faith he) if there were, it would produce nothing. But this hinderth not, but that a living creature may be generated in the fire without feed; but of some other fit and convenient matter, as we shall see anon. Besides, the Philosopher seems here as
likewise elsewhere) to speak of that fire only which is under the sphere of the Moon, that that particular living creature, not of ours, where there is both mixture and no pure fire. But you urge: Our fire is Subtilitas mutabilis, a substance not of the kind of the general fire, but such as is found in the motion of the air, and which is by no means able to consume or turn into its own substance. This was anticipated before: when we intimated in some things which are rather perfected in the fire, and which fire is by no means able to consume or turn into its own substance. It is Laugiis (a man of much reading, and a most learned Philosopher) and from him Cardane gather that some Animals may live in the fire, but not that they can be seen there; for in this they yield to the Philosopher. But who feeth not how absurd this yealding is? for I cannot see how things generated in a temperate place, should be able to live in that extreme. For that which they say of the Salamander is as good as nothing. The Salamander (as Dioge. hath observed) doth not live long in the fire: for as soon as that matter, which runneth down on every side from its yellow spots (as I conceive) while it itareth in the fire, is consumed (which is quickly done) it is presently brought to ashes, as Pennins hath made trial with our Brunens in the Country about Heidelberg. Erazmus a most learned Philosopher, disputing about rotten Feavers, endeavoures to overthrow all this History with these arguments. First, because Arifotes compiled the History (faith Erazmus) who, it is confessed, writ many things from hearsay; I grant it: but then he adds, ipsius, as it is reported, or some other word of the same importance (as Niphus hath well observed) even as in that very place, speaking of the Salamander, he addeth, qui eum. We may observe that this is the constant practise of the Philosopher when he speaks according to the opinion, or from the relation of others; but grant it to be, that he from others related it; they were deceived (faith Erazmus) who related it to him; imagining those creatures bred in the fire, which fell by chance into it. But the circumstances of the place make it appear that this is false. If they had fallen from elsewhere into the fire, surely by his own condition they would be consumed by the fire. And unless they had been bred there, (as I said before) how should they be able to live in such an extremity of flame? Besides, spectators have observed the motion of their feet, the number of their wings, their flying, yet their death, and the cause of their death viz., their flying somewhat too far out of the fire. These things and the like evidence that those relations were not at all deceived, but that they related what was true and unquestionable. But no Author either before or since Arifotes affirms this, but one or other perhaps who hath transcribed it from him. This is more (Erazmus) than you know, you have not read all Authors Books: the greatest part of books is lost, as it appeared plainly out of Athenaeus, and Histories bear witness. But how I pray you, came Pliny to be assured that Fire-flies have four feet? He did not learn this from Arifotes, nor is there any such thing to be found in his writings which are extant. Wherefore either he learnt it from others, or else the History was known in Pliny's time. Pliny therefore added this, that he might make up the History compleat. Nay, if you had read Ciceron de Nat. Deo. you had found him affirming for certain, that there are little winged creatures bred in the middle of the fire. Neither did I before think you so ignorant in Theology, as not to know what S. Augustin (l. de Civit. Dei c. 2.) hath observed of thete Pyribia: There are, faith he, creatures which live in the midst of the fire; and there are found some worms at the Spring of hot waters, whose heat no man toucheth without harm: while these remain there not only without receiving any hurt, but are not able to subsist out of them. And Vincentius his, Nat. l. 20. c. 68. In some waters which are naturally hot, there are certain Worms which live as well as Fishes in cold; may they go out of those waters into cold they die. Solinus also confirms it c. 17. who calleth thee kindes of Flies Carypeis, and reporteth that in Crete they fly into hot furnaces without harm. Yet and Seneca (qnst. natural. l. 2.) affirmeth that some living creatures are generated of the fire; and therefore these Fire-flies likewise; as lately Marfilus Cognatus reacheth us in a large Discourse Varr. obserr. l. 1. c. 23. 24. Do not then any longer contend, that no Author either before or since Arifotes affirmeth it; since besides those pious and grave men already named, I can bring others also, who would convince you either of plain falshood, or of a levity not hard to be discerned. But Theophrastes makest no mention of it in his Book de Ignes. What do you conclude, Erazmus from thence, that the History is false? Very fine. Perhaps he believed it; is it therefore false? But it is probable. I grant it. There are many things probable, and yet false; as experience teacheth us. Erazmus wrote many things against Paracelsum, which are probable, yet not all true, unless those things which he understood not, be true. Certainly he endeavoured to confute many things, which I know he never understood: I will not now descend to particulars. Well, but the heat of fire is not poison, fit for generation. This, Erazmus, you apprehend not; but I told you before, that if it were in the lead, it were not, which was the Philosopher meaning. For it is obstinato, corruptivo, according to Arifotes. I have answered before, that fire doth not corrupt those things. This bareness is therefore, or (if you please) destructiveness of the fire is to be limited. Nor truly can I consider this to be done miraculously, but by the power of Nature; neither do I take it for a tale, but for a History agreeable to nature. And as for what he writeth of the Salamander, he adds ipsius, as I said before: there was no need to add it. But I beseech those who believe nothing but what they see, to tell me, Have any one of the ancients found fault with this History, or confuted it? I speak of the Greek writers. No, not so much as Galen, who otherwise is a most sharp reprehender of the Philosophers, and would have laid hold on this instantly, if he had had any
any such opinion. Therefore it is likely that the history is true, because none of the old writers found fault with it. But come now to Matthiolus, who of all men hath contradicted this history most unhappily; for in his margin he inveigheth against the vain opinions of the Philosopher (as he thinks) where he appears in some things vainer than vanity it self. But I will return to the business. It is unjust (as he) the work of nature, Is it enough for Matthiolus to say for though he prove nothing? If the story had been true, Galen would never have omitted it, which hath fetched out all things else so diligently, furnaces, and metals, and what not? Tullus Scalliger will make anives to what end should he repeat a thing known before? Sooner would he (as he was a famous and a malicious character) if he had not found it so, have repressed it, as he doth in some places make it ridiculous. Which continued so few dates, did not understand the whole matter; they were not, they are not always at hand; he never enquired of the Bakers. But if I should say that a little the colt newly foaled should have plenty of milk in its eider, and that it did illue forth in great quantity, what would they say then? yet nevertheless I saw it at London about six years since, as also many others of good note and credit, who with their own hands did milk it out of its teats. They will say perhaps, we do not believe it; let them chuse, it makes not much to the matter; there are many productions of nature, the caues whereof it is impossible for any man to know, much less to flew to others. And that certainly not without great reason, that we might both admire the infinite power of God, and acknowledge our own blindness and ignorance. For these and the like did God create only for his glory, that he might both confound the shallow understandings of men, and also learn them to acquiesce in his wisdom only for so much as in searching out the natural caues of things, it is impossible to go any farther. For this is amongst the works of God that may pluck down our ambition, and makes us with all our wit to fly to that common Anchor of fools, namely hidden caues and the whole substance. What have we then to do? barely only to apply our selves unto him, from whom all wisdom, knowledges, and perfection doth proceed; for whilest we relie on our own wits, and do pry into the Majesty of God, we must needs (as Solomon in his Proverbs speaks) be confounded by the same. What then remains? this surely, that they which think these things to be impossible, do keep their opinion to themselves, without medling with those that think the contrary.

The Author of the Geoponikis (if I am not deceived) calls this little animal a Salamander: his words are these: Σαλαμανδρος της ερημης αυτος ειναι μην η εστιν ωνη, or, that is to say, The Salamander that little creature is begotten in the fire; and living in the fire is not consumed by it. Here he tells three events together. For neither is this the least of creatures, but oftentimes bigger, sometime less, neither is it generated by the fire, nor doth it live long in the fire, as I said before; out of Diosteres. Thus much I thought good to add, lest young students reading the Geoponikis should errre fouilly with Zoroafles. For what purposes it serves, I cannot boldly say; yet by its place of growth and principles it seemeth to dry and cleanse powerfully. It is also of very thin parts and body; it pierceth to places very distant; and truly if the Grailhopper which feedeth upon air, be of so burning a faculty, what shall we think of the Fire-fly, which eateth and drinketh flames? But the Fire-flies are of this use to our minds: they represent to us the understanding the wonderful power of God, who hath made the greatest of all the Elements, Fire, subject to so small, so dry a creature; vouchsafing to be vanquished by these while it craweth, I do not say to be vanquished (as we may say) to make the leaeth of the Tipula, Dis. Cane. Colog. 5.) but even so much as to be touched by men, or the greater Animals.

Chap. XXVI.

Of the Water-Spider.

The Water-Spider is next, a little creature of exceeding nimbleness, whose History Authors have so slightly handled, that we can hardly pick out any thing of weight or moment towards the illustration of this History; we shall yet perform what we can.

I utterly deny *Anser* in Aristoloe to be the same with Tipula in Plantas (as Gaza interprets it) for I am not persuaded that Mule-gnats can come of them.

It is called in Latine Tipula: Plantas, Felius, and *Nomine* Marcellus write it Tipul; others, *The Name, Tipula; Guillerinvs de Coutvs reads Tapula; Albertus and Vincensius in his Speculum, call it Tappula: none of them ariight. By Plantas it is called Tipula; in Greek (as I found in Gefner's papers) γατυλ, which word truly I finde not any where any footleps of, nor can I tell what it properly signifies; some High-Dutch call it Wafer-gemor, which is to say, a Water-goat; others Wafer-pin, which is a Water-spidere; the Nether-lands, Wafer-pin; with us it is called the Water-spiders as with the High-Dutch and Netherlands, for likenes sake; in Spanish, Gufano que corre sopra el aquas a worm that runs upon the water; in Italian, Capra di aqua; in Poloning, Wood ny ciceluck.

There are two sorts of Water-spiders, the greater and the less. They differ in signets only, or perhaps in age; the greater are more common in coldt waters, the less are somewhat more blackish and of a more compact body,
The greater more inclines to an all-colours, being of a larger body.

Although several men write severally, and neither tell any certain marks whereby it may be known, nor agree in the number of its feet, yet I hope we shall so clearly and periphrastically explain in the History of the Water-spiders, that there will be no occasion of doubt left hereafter.

The Water-spiders: a little creature, in shape very like a Spider, of a body somewhat long and fatter: it hath four feet, or to its body, and two little arms stretched out before near its mouth, perhaps in head of one: which if you reckon with its feet, it will have six feet; which yet (so far as we could observe) it used not when it runneth: they are as short again as the reit of its feet, neither have they any knots or joints like the other feet. Therefore Albertus and others allow but four feet to the Water-spiders: but Fēlius, reckoning these little arms together with its feet, It hath four wings, very feeble ones, which seem not to be made for flying, but for leaping. They are also ter than its body, and the uppermost of them a little thicker and larger than the others, but yet not of leather (like those healthy cases) they are between a brazen colour and a black; the inner wings are lighter and thinner, and of a silver colour. Whether they fly by night like Water-beetles or not, we are uncertain; they leap sometymes upon the water so lightly, that they scarce do much asflit the surface of it. Hence grew that proverb among the Ancients, Lighter than a Water-spiders. So Petrus being to express the lightness of men; and Virgil, the nimbleness of Camilla, compare them to the Water-spiders. Plautus likewise in his Perīs Néq: Tīpula levissimi pondus quam fides lenonis (for to Lambine reads it, against the content of all copies, even that of Nonius) A Πανδάρρη βελτίωτα is lighter than a Water-spiders: It runneth not in a continued course, but with intermission. It goeth not under water, but when it is driven thither by force: its body is never wet. They are found all the Summer time in standing waters and ponds which are free from the wind, and quiet: sometimes also they are met with in rivers, especially close by the banks of great rivers, and for the most part under the shades of trees (as of the willow, or any other tree, (which is not over tall): most commonly multitudes of them are together in companies. They are seen sometymes to couple leaping on one another backs, but they make an end of engendering very quickly. One shall hardly find any one of them in Winter.

Whether they be of any use in Phyfick, besides the common use Flies are of, we leave for others to make experiment: for we know of none; nevertheless we utterly deny that their little creatures were brought forth by nature to no purpose. Certainly the Grudgeon, the Rochet, the Perch, and other inhabitants in the dominions of the waters do sufficiently declare how useful they are for the feeding and fattening of Fishes. Without question Fēlius, Nonius, Marcellus, Sipontius, and others, mean this Water-spiders now described, as it will appear by their words. The Tīpula (faith Fēlius) is a kind of little creature, having six feet, but so light, that in running upon the water it seemeth to take no steps. Fēlius faith upon the matter: the same, The Tīpula (faith Nonius Marcellus) is a very light creature, which doth not swim but go upon the water. Varro thus: Leves Tīpulam levissimam frigidos transit lacus: for to the place which is corrupted, is to be read and corrected: The light Water-spiders very nimblly passeth over the cold ponds. Albertus Guillerius de Condisc, and Vincentius call it Araeolum Aquaticum, interpreting the Dutch name (for it hath some likenetis with the Spider) ascribing but four feet to the Tīpula, not reckoning the little arms which are before, among its feet, since it doth not use them in going. Others (as I said before) reckoning those little arms among their feet do allow Water-spiders six feet. Hence it does most certainly appear, that we have described that very Tīpula which Plautus mentions, so that there is no room left for any one doubting hereafter. But before we go any further, the truth requires of me, that I confute two notorious errors of Guillerius de Condisc. The first error is, when he faith that the Water-spiders live alike upon the water and upon the land: the other, when he faith, that it runneth very swiftly upon land; both which do evidently contradict experience: for upon land it doth not live long, nor run at all, but move with a very slow pace, and sometymes leap, but that very little.

Whether Catarab in Aviceon, which is called by Silvestrianus Catarbus and Eckemnbur, be the Water-spiders (as Wierus thinketh) I cannot say for certain: although indeed I am easily persuaded by reason of the circumstances, to believe that Catarab in Aviceon is not the Water-spiders. But let us hear Aviceon description: Catarab (faith Aviceon) is a little creature having its being on the surface of the water, which moveth upon it divers wates without order, and divers ever and anon to the bottom, and presently appeareth above again. Silvestrianus hath almost the same word for word: only he adds, that whenever any thing happenes amiss to it, it runs away, and by and by appears again. From this little creature by reason of its restless and disorderd motion, hither and thither, that kind of melancholy which the Greeks call νηστήσια, the Latines Infania Lupina, is called by Aviceon Catarbus and Aleaturbus: with which when men are taken, they fly from the living, and go out by night, and frequent graves (as Wierus writes) and think indeed that they are turned into wolves, as Wierus writes he believeth a certain husbandman in Germany in the year 1541. The Ancients (faith Wierus) call a fly which is common in moorish grounds Tipula. And we think Manardus made mention of this somewhere in his Epistles. Wherefore I am fully persuaded that Catarab is not this Water-spiders, but some other little creature,
Of lesser living Creatures.

CHAP. 27.

They are the least of the kinds of Water-beetles, which with a radius motion move not almost continually upon the surface of the water hither and thither without order (as we said in the History of them) and upon the least disturbance of flitting of the water, goeth to the bottom, and presently hides it self in the mud, but by and by alone as the billows are down, fifth up against the surface of the water. This little creature is seldom seen but many of them sport together in the same place, running up and down several times. I was once wont to behold with great delight these little very black and shining Beetles pulling one another, and as it were wrestling together. But of these we have spoken at large among the Water-beetles. And we shall take Caesar's Tipula into our consideration among the Water-worms.

The word *Tipula* which they interpret *Tipuli*, makes nothing toward the illustration of this History.

CHAP. XXVII.

Of the Forficula, or Earwig.

A *Romanus* his *Forficula*, is called by the later Latin writers, *Auriculata*; by the more Ancient, *Mordella*; *Neplius* calls it *Velicula a vellicando* from rending; the French call the Earwig *Aurelii*; *Ocrea-vire*; the Germans, *Oren-worm*; the Low Dutch *Ooremetel*; the English *Earwig*. *Haustrinus pennius* thinks it to be *Fullo*, which notwithstanding much differs from the form of a Beetle. *Is this the Greece *Orobinon*? truly both the original of it and the biting agree thereunto; for this is bred also in the hollow stalks of herbs, (as of the wilde Partipip, Angelica, *Fennel Gigant*) and is frequently seen in Coleworts. The Northern English by an obscure name call it *Twick-hullock*, as if you would call it *Scrotomordium*, or *gaz-saw*; for where ever it finds a rivetled plated skin, it will cause very great pain, either by biting with the mouth, or by wounding about it with its forked tail; which *Pennius* faith once hapned to him being a boy. For we fell upon two sorts of Earwigs, both were with wings, contrary to the opinion of many. For if you force them here and there back again with a bull-rush, when they are hemd in some place or upon a table, (which the most illustrious *Knivet* taught *Pennius*) they will presently open their wings that are hid under their covers, and fly away.

You must take diligent heed that you pref it not too hard with a straw or with rushes, or wound it, for then it would never so long be fly away. The more common is seen with a light red colour; his foreyers, feet, and forked tail are yellow. The other (which is more rare in England, and was seen by me but once or twice) is greater than the former, and of a blacker body, hath a fiver ring about the neck to adorn it; the outward covers of the wings are of a reddish colour: the mouth is forked and yellow; on the back on both sides near the sides, there are five yellow spots, the fork of the tail is short and black, and the fist this toward her head and flies, being angry, into the air.

They are oft found in Coleworts and hollow Reeds, and in the little bladies of Elm leaves. They breed of worms that breed in the stalks: they yearly call their old skin, and that being gone they look white as snow. But with age it grows again, and is died with its ancient colour. The English women hate them exceedingly, because of the flowers of Clove-gellicflowers that they eat and spoyl, and they lay innes for them thus: They set in the utmost void places Ox-hoofs, Hogs-hoofs, or old cast things that are hollow, upon a staff fastened to the ground, and these are easily float with clothes or straw: and when by night the earwigs creep into these to avoid the rain or to hide themselves, in the morning these old cast things being suddenly taken away and shooed forth to the great multitude of them falls out, and are killed with reading upon them.

*Romanus Breviar. 1. cap. 25.* bids us to boyl them in common oyl, or oyl of Hearts-ease and with that to anoint the arteries of such as are in a Convulsion, both their temples and wrists, to cause a Fever, which is a remedy for a Convulsion. *Josepbus Michaelis* an Italian and a famous Physician, is wont to collect a great number of them, and to bring them to a fine powder in a glass very close stop. Then he mingles as much powder with Hares piffles, that he may pour into the ear morning and evening. He often proteted to *Pennius* that this was a secret to cure deafness. Others mingle the powder with oyl of Cloves and use it as before. The smaller *Galldinga* (which the English call a Suite) and Hens feed on Earwigs: and I well remember that I have found a great number of them in their Mawes.
CHAP. XXVIII.

Of the Scorpion, the Ant, and flying Lice.

Aristotle, 4. de partih. c. 6, denyeth that Scorpions have wings; Scorpions (saith he) move not flying but going. But latter ages since him have seen and acknowledged some of them to be winged. Apollodorus (writeth Pliny) relateth that some of them for certain have wings, which Nicator also hath recorded, Panemunis in Basiiic, speaking of winged Serpents; but their words: Neither ought any one to too forward to believe those things, which Nature more rarely representeth; nor yet to be altogether incredulous concerning them: I never saw any where flying Serpents, yet am I candidly persuaded to believe that there are such, because a man of Phrygia lately brought into Ionia a winged Scorpion of the Locust kind. Paramenon also l. de Best. Venenatus in aegypti. reporteth that he saw, not with other mens eyes, but with his own eyes, Scorpions with wings, and armed with a double sting in their tail. With whom Aelian agreeeth l. 16. c. 425. 43. Megaphenes hath recorded that there are some in India among the Paphis, which have wings, and are verae ontos addontes, exceeding great ones. In Apollon likewise there are some winged, and others without wings; having seven joints in their tail, faith Strabo l. 15. Geogr. c. 17. The Pythi (faith Pliny l. 11. c. 25.) have often endeavoured to bring them over into Italy but they were not able to live beyond the climate of Sicily: Yet there are seen of them sometimes in Italy, but hamlitt ones, and in many other places, as about Pharsus in Aegypt. We read also in the History of Navigations, that Ambulus the Portugals, while he layed at Palmyra (it is a City faruate by Ganges towards the East, and according to Diodorus Siculus built of old by Hercules) saw there great frote of winged Scorpions. It might be called in Latin, Nepales usque Nepa alatae, for so Plinius calls the Scorpion in Cosmographi, when he faith, Recellum cedam ad varietatem omnis formae. So again Cicero 5. de Finis. Nepas usque us videtam. Vater alio et COLUMELA do frequently call the Scorpion by that name, although Paphis underlayd by it a crab. Aelian writeth that that name was borrowed from the Moors, by whom Scorpions were first calleth Nepae, and brought into Italy. Thou feest here its ordinary bigness and shape: It is of a colour very like honey, whereupon it is called melipomene. The last joint of the tail in this kinde is black, armed with a double sting, as if one could not do mischief enough: it hath wings like the maxible of the Locusts, it goes obliquely and after the manner of a Crab; it is very hump- full to men, especially to young men and boys. Aelian attributes to it a glittering red colour, and calleth it flame-colour. Its poyson being hot, caufeth extreme heat; which happeneth otherwise in the Scorpions which have no wings. It kills Lizards, Adders, Spiders, Whirls, and all kinde of Serpents. Aelian l. 8. c. 13. This kinde of Scorpion likewise being applied to a wound made by it itself, healeth it, as others do: and if the smell of one of them burn to come to other Scorpions, it driveth them out of a house.

Its Generation is after the same manner with theirs that have no wings, of which we shall treat at large in the second Book.

The Ant is called by the Latines Formica, to serenis meonis from carrying grains of corn, faith Lidor. The Greeks call it μυρμηγκας, μυρμικας, βυξαντας, εριφωνικας, and εριφωνικας, by Hesychius and Varinius; it is called in Hebrew, נפתס; in French, Fourmis; in English, Ants, Emmett, Pismire; in Spanish, Hormiga; in Italian, FORMICA; in the Slavonian and Polonian Tongues Mravenres; in the Illyrian, Mpowka; in Low Dutch, Mieren; in Flanders, Labets; it Dutch, Omay; Ommes Eims. Now some Ants are winged, some without wings. The Greeks call those that are winged (of which only we treat in this Book) αντιες; another calls them πτερωμαι; they are named by ARIosto deli irontiori, and simply irini, l. 1. de Anim. part. by the Latines Equites, because of their exceeding swiftness, wherein they excel the others. They are of a larger body and bigger limbs than those that go and have no wings, (whereupon Pliny, if I mistake not, calleth them Herculanas) and of a middle colour between black and swart: they have four silver coloured wings; their uppermost bigger and longer than their whole body; their inner wings half to big. I have nothing that I write for certain, concerning these Indian flying Ants. For Authors themselves are uncertain, and many late writers, having travelled over almost all India on foot, have yet found none of those gold-hordes and devoures of flesh; Of which Megaphenes hath recorded thus much: There are found (faith he) among the Darda certain winged Ants no les than Foxes: Now the gold-dealers understanding that they feed upon the flesh of wild beasts, threw pieces of it along the waves, and so while the Ants are over- borne about their meat, they take away without danger all the gold they had all this while stolen. Onegerius writeth that he saw some of their skins like Panthers skins. The Book entitled De Natura rerum, so describes this winged creatures, with hooked claws, a winged body
body, and a crooked beak, that one would take it for a Griffin rather than an Ant. That Ethiopia also breeds such, we read in Philostratus, who placeth Ants and Griffins also in India; which are not very like one another in shape, but both trusty keepers and diggers up of gold. The horns of the Indian Ants let up in the Temple of Hercules at Ephesus, were a wonder, as Pliny testifieth, or rather lieth. He that desireth more dreams concerning them, let him read Herodotus, Ariannus, Teuctes Strabo, Alian and Pliny, who gave so much credit to lies carried to and fro and entreated, that they were not ashamed to put them down even for truths. But passing over the Indian Ants, let us treat of those in Europe only: whole course of life, fights, victories, policies, prudences, sagacity, patrimony, cunning, frugality, industry, economy, charity, fidelity, civility, valour, and labours. I would to the fame of men represent here; but that it would be necessary to repeat the same things in the second Book, when we shall treat of those go, with which they agree in nature, and belong to the same Common-wealth. With these Herculean Ants brutified, and Salt and Pepper put to them, the Magicians, the Leoprocus, and the Scurie are cured. Pliny made of winged Ants, provoketh and strengtheneth Venus. Wecker. To conclude, whatsoever differeth other Ants are good for (and they help very many, as you shall read) the winged ones have the same or greater virtue in curing of them.

Agatharchides tells us, that the Acerophagi or eaters of Locusts are not far distant from the inhabitants of the Red Sea; which nation are of a lower stature than others, lean of visage, and extrem black. About the Vernal Equinoxial, when the South-west and West winds blow with the Italians, an unpeakeable multitude of great Locusts is brought to them with those winds, out of some place unknown, which differ little from birds in their faculty of flying, but in the shape of their body very much. With this sort of creatures they are nourished all this season feeding upon them fairest or otherwise dead. And they catch them by fetching them down from the air to the ground with a smock. And these people are reported to excel in nimbleness and swiftness of foot, but taking a very dry nutriment, they do not prolong their life beyond forty years, nor can they move miserably than they lived; for when old age drawes nigh, there breed in their bodies certain sorts of flying Li-e, in figure indeed like Dog-flies, but otherwise less; they begin at the breast and the belly, and in a short space eat up all the skin of their face. Others of them are taken like those which have the Ithch, thereupon they tear themselves grievously, and at length the disease being at a flay, and thin hours humouring at the coming out of these little creatures, they are lain poor wretches to undergo intolerable torments, and so by reason either of ill humors, or of their feeding, or of the badness of the air they die. Hieron. Mercuellial. de marb. cont. ex Dier. doro Sicula 4. Antiq. lib.
The Theater of Insects: or, Book I.

Pliny, denieth that they have any vertue in them. But Pliny many waies commendeth the garden Wall-lace, being reduced to ashes and infused in oyl of Roses, against pains of the ears. Pallasinus writhe the with the Lees of Oyl, an One Gall, Ivy-leaves and Oyl, for an oynment for the bitings of venomous Horleeches. Let the head of the yard be put into Oyl of Camomil pretty hot, in which Wall-lace have boyled; then let the head of the yard when it is taken out of the oyl, be anointed with pounded Garlick, and the patient will certainly make water. Arnaldus de villa nova l. 2. Breviaris e. de stranguria & dysuria. Are not these to be taken for those Wall-lace, which the Dutch call Knolters and Sualfiers? And hitherto hath been said what we know of winged Infects; ye Plutonis, Comenravins's, Clibus's, Quiekgelbergin's, and ye later and more laborious fons of Esclapius (whom Phoebus moulded out of richer clay) if you have any thing which is here wanting, make addition of it, according to your wonted courtesie and ingenuity, remembering that of the old Poet:

Kal Re vi, & rete vi, & deporte al Mavens Angel.

When you receive, you ought to give withall:
The Muses gates are wide, and liberall.
Of the Division of the Second Book.

The Preface.

By the clew of Dedalus we are at last got out of the Camps of winged horsemen; where should I relate with how many stings the Insects of the lower ranks have assailed me, how much they have troubled my brain, my right hand, my eyes, whilst I accurately dissected and observed all their parts, truly I should either faint in rehearsing the wounds, or what I was resolved in my minde to finnish, I should not be able to do. Wherefore, what valiant Souldiers are wont to do, whilst the wound is yet fresh and hot, we will break forth into both Armies, and with better undertakings, so far as may be, strive to overcome them. Thou O great God, who in the Inventory of these smallest Creatures, makest the most excellent understandings to stand amazed and stupid; give me strength, that as by thy goodness I have mustered those Insects that fly, by the same I may be enabled to draw forth all those Foot-forces that want wings; so that in all my labour, I may seem to have no other end than to seek thy glory, to advance learning, and nothing that concerns my own particular, but that I may finde thee in these thy works. Go to therefore bold Atheist, who art ignorant of God and the Divine Perfection: endure, if thou canst, the biting of the Spider Phalangium, or of the Scorpion; abide the pain of the Worm Scolopendra; swallow down the Pine-tree Catterpiller, contend with Worms, despite with Herod, biting Lice, so much as thou art able, at last thou shalt finde that there is no foot Souldier so mean in this Army, that will not quickly overcome all the forces of thy body and minde, and will make thy foul mouth to confess, by their ministris, that there is a God. Thus then I draw forth my Regiments, so I muster the Souldiers.
Some with Feet: The Catterpillars, Beetles, and such as are called Scaphylyni.

Some with eight feet: The Scorpion, the Spider.

With six: As Wasps, Glow-worms, the female Meloe; also Worms in woods, trees, roots, fruits, meats, garments, chambers, humors.

Some without Feet: As Orpns, Maw-worms, Earth-worms.

All Insects without wings are either belonging to the Earth or Water.

Some swim with six feet: as the Shrimp, the Lake Scorpion, the Notoneum.

With Feet: As the Sea Scopelopods, the many-footed Shrimp.

Without Feet: As the Horsetail, the Hair-worm.
We thought fit to place in the Front, Catterpillers, the devourers of 

Peaches, or, Telphic; for some of them are excellent for their use and worth. It is no fond conceit to maintain that Catterpillers had their name in Latin from devouring, for they eat up leaves, boughs, flowers, fruits; which also may be observed in the

Field-worms that weave their hoary thread on boughs; we finde

That they with painted Butterflies do change their kind.

The Greeks call a Catterpillar σπυρος, from the waving and vaulting motion, when it creeps, whereby it lifts up and contracts it self. The Hebrews call it Ghazem, because it sheareth the fruits of the earth, as Kimhi faith on Joel the first. The Italians call it Rugga-worms and Bruchi, for so faith Marcellus Virgilius upon Dioscorides. In our times, faith he, our whole Country calls all kinds of Catterpillers Bruchi. The Spaniards call them Oruga; the French, Chenille; Catter-pilercs; the English by the name of Catterpillers; but the Northern people call the hairy Catterpillers Oxbuts; the Southern call them Palmer-worms; in the Poles language, a Catterpillar is called Rup hasenka; in the German Tongue Eim Rupp; in Low Dutch, Ruppe; in Scolvinsith, Gachenica; the Pendants call them Cervus and Cedrooa.

I should be endless if I should add all kinds of Catterpillers; for some feel rough, others soft, some have horns, (and that either in their head or in their tail); some are without horns; some have many feet, some fewer but none have above fifteen feet. Most of them move twilly in a waving posture; yet others there are that go even and flowly. Some do yearly change their old skin, and others do not. Some are changed into Aurelia's fixed above the earth, whence are bred your ordinary Butterflies; others are transformed under the earth, and become Glow-worms. Also some of their Aurelia's are smooth and equal; some again are hairy and wrinkled, pointed at the ends, sharp; some (namely of the harder kind) naked, but others (namely of the tenderest) are covered with moss or fellen down. The most of them are bred of the eggs of Butter-flies and are changed into Aurelia's: some are bred on the leaves of trees, of the proper feed left there in the web in Autumn; or of the dew or air that is up in it, and corrupting there, as Vine-berryers. Some again feed on leaves, some on flowers, and some on fruits. We, to express both kinds of Catterpillers, shall divide them into those that are bred from other things, and those that are bred from their own kind alone. Such as are bred from other things, again are either smooth or hairy; as also those that proceed from their own kind, Amongst the smooth Catterpillers, the Silkworm defervently challengeth the first place.
A worm, that is, a Fly transformed, and then transformed back, once more is made a worm again; twice it both dies and lives anew, is wasted, or "beaten twice into the Elision pure."

Its successor is left half living and half dead.

Which gives this silk-worm makes, why do they labour thus? It is not for her self nor labour, but for us.

Her issue was formerly an ornament for Kings, but this prodigious age confusion brings:

So prodigious, silk, that bile, rabble, cloaths, Gossip-wives, herb-women, singing silk suits and gowns: Nothing more common now for all silk, attires, which waste and burns men's hearts with continual fire.

In which words, though our divine Poet, who was more clear than the ancient Birds, doth something approach upon the Silk-worms, and paint them forth, yet he doth not describe them so fully, that it may suffice for the History of them. For Silk-worms are smooth Caterpillars almost of a milky colours, with small black eyes, and as you see, with a fo toed mouth. The snow white ones are bred of Butterflies eggs, which growing by degrees into little worms, produce Silk-worms of the same colour with Butterflies, And that I may not repeat this again, let it suffice that I have once said it; the butterfly is almost always of the same colour with its Caterpillar; That Butterfly taking its Aurelia, as many eggs as it leaves, or seed (if you will) like to eggs, they become so many Silk-worms after wares; which, if you cherish them, when they are fostered by the Sun's heat, and full fed with Mulberry leaves, they will repay a reward worth your care and, namely, a silken fleece. They breed first in May, in which month and the two following months, they devour a multitude of leaves, and in eating as it were by sucking, they harden; when they are grown up with plenty of nourishment, being become able, they spin a most fine web out of themselves, like to a Spiders web. Then against cold weather, they grow rough with hair, and make themselves new thick coats for Winter; by the sharpness of their claws, pulling down the lower of their skins, into fleeces; then they thicken and close it, carding it with their feet; then they draw it out amongst the bushes, and make it small as a comb: lastly they take hold of this web, and warp their body in it, making a round fold. Then men take it, and put it on in earthen vellies, and feed them with bran, and so they spring up feathers of their kinds; which so soon as they are prepared with; they are set to perform other tasks. But the spinning work they began, grows pliable by moisture, and is spun into threads on a full spindle. Some women do use to draw it forth into yarn, and then they weave it. Pamphila the daughter of Latona was the first that was reported to have woven in the island of Co .. At Pho reports that Silk-worms are bred in that Island, Plin. lib. 11. cap. 22: the flowers of the Cypresses, Turpentine, Aths, Oak-trees, being beaten down to the ground by fowiers, whence they receive life. Though women were the first inventors of this Art, yet men are not ashamed to wear these garments for lightness in Summer. The cutom of men are so far degenerate from Arms, that their very cloathes are grown burdensome. The thinner and softer the leaves are they feed upon, the finer Silk theye Silk-worms make; whereof amongst the people of Sera in Syria, the most foil garments are made; which we call Silken, as Marcilinus Wuntellius, lib. Hist. 23. In India also and in Egypt there is great plenty and use of them, and are brought from thence to the Spaniards and Italians; being the greatest source of Wantonness amongst mortals. So often as I consider, that some ten thousands of Silk-worms labouring continually night and day, can hardly make three ounces of Silk, so often do I condemn the excessive profus on and luxuriosness of men in such costly things who defile with dirt, Silks and Velvets, that were formerly the ornaments of Kings, and make no more reckoning of them now, than of an old tattered cloak, as if they were ashamed to esteem better of an honourable thing than of a base, and were wholly bent upon waste. The Greeks call this Caterpillar Spin, and Bombyces, which name is become Latine. The Italians call it Ligato; the Spaniards Gnafione della feda; the French, Ver à Seye; the Germans, Ein Seide woomer: the English, Silk-worm. Amongst whom a Silken habit is so much loved and valued, that they despise their own Wool, (which compared with Silk, is not contemptible, and is the most profitable and the greatest mercadishie of the Kingdom.) But time will make them forget this Wantonness, when they shall observe that their moneys are scattered up in Italy at that time, when they fland in need of it for their private or publick affins. This is a pleasant thing and worthy to be noted, that the head of the Silk-worm, makes the tail of the Butterfly in that golden coloured Metamorphosis, and the tail the head; which also happens in all other Caterpillars that are changed into an Aurelia.
CHAP. 1. Of lesser living Creatures.
Of the rest of the smooth Catterpillars.

All the other smooth Catterpillars, are either green or yellow, or reddish or dark, or various colours. The chief Catterpillar of the green is that which hangs upon the Privet; a circle surrounds the face of it, and all its feet; and it hath a horn turned backwards in the tail. They are black and red, spots are made athwart their sides, they are half purple, half white; the small spots are red, but their whole body appears green. That upon the Elder-tree differs not much from it, but that it is altogether green, except those overthwart spots very white and some little points like milk. It chiefly feeds on the reddish coloured Elder.

The third, that is all green, when Autumn comes is transformed into a blackish case: it feeds on the softer Pot-herbs, especially on Lettice, whence we call it the Lettice Catterpillar.

The fourth upon the Medlar-tree is less, all over green, drawing itself into an auburn-coloured case, all besprinkled with most black spots.

The fifth is leaf of all, spins its threads on trees, (especially upon the Oak, and descends by them upon the heads of those that pass along, and intangles their hats and cloathes: a very little creature, most noted in Summer, and obvious every where, when the fall of the leaf is at hand; he wraps himself in a course web, and being shut up in a red and green cover, he dieth in Winter. He hath but ten feet, as all the rest that went before had.

We call them yellowish, that are most part yellow: such these figures present you with, which is kept, wherever they are void of black, overcast that with a paler yellow, and you have their figures painted. They live on softer leaves, especially on the Tiel-tree.
Vinula is next in order; which is a most delicate Caterpillar, and beautiful beyond belief, we Vinula, have found it on the Willow feeding greedily, the lips and mouth of it are a pale yellow, the eyes are fiery, the forehead is purple, the feet and the lower body green, the tail is forked, blacker than grapes, the whole body is spotted as with thick and dark red wine, which paling from the neck crofsway to the very tail, a most white line doth wonderfully adorn it.

Three various colours are chiefly observed: the first hath a bleweif face, and very black eyes, the outward skin of the back is grayish, much beprinkled with black and yellow spots: it is changed into an Aurelia of a bright bay garnished with a white small membrane: it loveth Cabbidge and all kinde of Turneps.

The second hath the head and feet and tail very black, being chequered with yellow; the cheque-rings that are painted on them inwardly, are distinguished by channels black and gray, drawn long-waies by turns. It loveth Fennel, and Anifieed, and Cummin.

The third is green from white, bunch as it goeth along, for it hath only fixe feet on both sides, as those before. It is changed into an Aurelia fee with pricks, of a dark colour. It consumes Olives.

The fourth feeds on Dragon-wort, and resembles a spotted Viper: it goes alwaies with the head upright, and leans chiefly on its breast. It loves Bulrushes, and plants that bear down, and are bred in rivers.

If you paint the ribs descending of the fifth kinde with old Minium, there will be few things in the picture that will not agree with the truth.

In the fifth what you see white, paint with Ocre. Both of them delight in the black Poplar-tree, and feed greedily on it.

The Caterpillar called Porcellus Dark, 2c. is black, brown, especially the greater, but the leffer hath the circles white. Frequently they are found on the leaves of meadow Trifolie, and they devour them with wonderfull swiftness.
The chamberings bred in the seventh, must be white from yellow; all the rest of the body is of a dark colour, and changeth it felt into an Aurelia, of a light red colour.

The eighth seems of the colour of anhes, waving out of black; it makes a cape between black and a bright red, whence grows a daily coloured Glow-worm.

The ninth is various, and dreaded by thought for: the roundels of the incisions are green; the horn of the tail is bent backwards; and of a bright shine; under which a red coloured spot serves to make it beautiful; the middle part of the incisions is anhes colour. Lastly, an Aurelia is included of a smurfy colour. We found this in the high ways; it delights in the field Crow-foot.

The tenth is gray and black; for what is here white, lay gray upon it, and it will represent the creature. It is changed into a spiral case, of a weak blow colour; the roundels being somewhat red; and it comes next to the form of a horn fashion peri-winkle.

The smooth Catterpiller comes from the wilde night-shade (which the Italians call Bella-domus) of a green and yellow colour; it hath a horn in the forehead as long as ones finger, which Cardani relates that he saw often.

**CHAP. III.

Of Catterpillers rough and hairy.**

Hoig with hairs are the most milchievous of all: some are very thick of hair, others thinner; whereof I here afford you the kindes. Amongst those of the thickest hair, are walkers up and down, such as are upon Nut-tree leaves, Pine-trees; such as have sayl-yards, such as are called Neufries; Pear-eaters, such as are upon Nettles, Cabbage, Hedges, feeders on Poplar, such as lose their skins, such as are amongst Marigolds, black and green, &c. Those that have thinner hairs are Echini, dwellers amongst Fennel, eaters of buthies, half white: of which we shall speake in order.

Pityocampes, that is, Catterpillers on the Pitch and Pine trees, are as thick as a mans little fingers, and as long as the breadth of three fingers. They have eleven incisions between their heads and tails, and they have sixteen feet like the rees, namely about the head on both sides three, on the middle of their bodies on both sides four, and at the ends of their tails on both sides one: but the hirt are crooked and small, wherewith they try their way, the tett are broader and jagged like sawes; that they may lick the fatter to the boughs. The head is like an Are, the feet like common Catterpilrs; they are rough with hair and encompassed on all sides with straight brittles; the hairs bred on the uides are white, they shine on their backs; the middle part whereof is adorned with spots like to eyes; the brittles being flaved off, there is a black skin underneath, their hairs very tender, yet they prick more sharply than a nettle, and cause very great pain, heats a Fever, prickings, inquietnes. For the poylon enters suddenly without any lethe of the wound, and is carried to the parts next the bowels. They spin fine webs like to Spiders, drawing and disposed their threads with their fore-feet. Towards night they go under thefe, as they were tents.
Chap. 3. Of lesser living Creatures.

...tents, that they may escape the inconveniences of cold and storms. The matter of this tent is so fatal and fine, that it is not in danger by the greatest winds, nor is it fob'd with rain: and it is so spacious, that a thousand Caterpillar may be under it. They make their nests in the small boughs of the Pine and Pitch trees, where they live not solitary as others do, but by flocks: which way so ever they bend their course, they spin and carry their thread for the web along with them; and at break of day, if it be but fair weather, the great ones accompany the lesser by troops, and having made the trees void of leaves, for they consume them all, they labour hard in weaving. Only these plagues of the Pine and Pitch trees do not meddle with other Cane Apple trees. In Mount Aetius the woods of Trevis and in the valleys beyond the Alpi they abound very much, by reason of plenty of leaves for their nourishment, as Matthiudus witnesseth. They are truly most venomous creatures, whether you touch them outwardly with your hands, or they be given inwardly. They were of old esteemed to certainly to be poisons, that Ulpius interpreting the Cornelian Law concerning private murderers, set down amongst them to be punished those that give a Pine Caterpillar to drink. Selii, Aetius, f. ad leg. Corn. de fe. When one hath swallowed a Pine Caterpillar, the pain grievously afflicts both the mouth and palate; the tongue, belly and stomach are greatly inflamed by the corroding poison: also a wonderful pain vexeth them, though at first they seemed only to feel a pleasure kind of tickling: great heat followeth, loathing of meats and a perpetual desire to vomit, but ineffectual. At length if it be not helped, they burn the body, and make the stomach crusty almost like to Arsenick. Dios. Aetius, Plin. Cels. Gal. Albo 15, S. 5, and deuc. 2. 25. Hence it is that Aetius and Aegina held it dangerous to set the table for meat under the Pine tree, or for to lay there, lest perhaps by the leak of the meat or vapour of the broth, or by noise of men, these Pine Caterpillars should be moved and fall down upon the meat, and should let fall their seeds, that are as deadly as themselves. They that are hurt by these must use the remedies against Cantharides, for the same means will cure them: but properly oyl made of Quinces, called melium, and oyl Olive, is to be drank twice or thrice to cause vomit, as Dioscorides from Aetius hath prescribed. They are bred, or rather regenerated, as Vine-fretters are, from Autumnal feed left in the web in certain bladders, or from the Vine-fretters themselves corrupted, as Scaliger thought.

Now we proceed to walkers about. We call these walkers, who have no certain houses or food: wherefore do something supefstitiously wander like pilgrims, and like to Mice, they always feed on other meats, wherefore the English call them Palmer-worms namely for their wandering life, for they dwell no where, though by reason of their hair they are called Bear-worms. They will not be tied to any kind of flowers or leaves, but they pass on boldly, and taste of all plants and trees, and feed where they please.

First those white spots which we see in their sides, must be such really; the whole body is black, all the inward hairs must be somewhat yellow, but all the uppermost on the back must be hoary, except tho' three ranks that are bred in the neck near the head, for they have the same colour with the hairs of the belly. Out of the Aurelia of this comes forth the Butterfly which you see here: whose colour, figure, and nature, we described in the Book before.

The second, if you make the neck and belly, and the hair there growing, yellow, you need do no more. The cover of it feems dusky, the eggs are pale. We explained the Butterfly that growes from thence in the former Book.

The third is, the whole body and hair, dusky yellow, but that the spots on each side being obliquely made in each incision lie hid, and the head being of a light red, is adorned with a certain white fork.
The fourth hath his belly and lower hairs chiskly; the back and upper hairs are yellow from dusky, a double forked line in the face resembles the colour of whey, or milk mingled with water.

The fifth hath a bright bay colour in the face, the sides of the belly hoary; a body various with small yellowish spots, and above these with black; yellow hairs come forth like small rags; they are sharp, and growing more sharp pointed from the middle: it hurts much the neighbouring herbs and the corn.

The sixth is a brown colour'd, if the incisions were not died with black and white spots here and there; the hairs are bred above and beneath, and yet after a few fashion; they are very rough and hard, but they are of the colour of the body.

The seventh hath a black skin, yet it hath hairs something of a dirty colour, I use to call it the Penfill, because on both sides of the forehead, and also in the rump a sort penfil breaks forth of a crown-black colour: but those wedge fashioned eminences that you see in the back, are white as milk at the root, otherwise somewhat black.

The eighth holds forth a Mouse colour, on whose back those seven joints resemble it.

The ninth is a strange and rare colour: for all the incisions are painted with various colours one from another, yet mingled one with another, which a silver fish doth adorn severally one by one.

The tenth is amongst the sports of Wanton nature, not less elegant than it is rare, being streaked with black, green, blew, yellow ridges, and smooth strings; which some golden spots do wonderfully illustrate: it hath very soft hairs, of an admirable and most pleasing freshness; it hath a purple cover fortified with a small membrane.
Suppose the white incisions of the eleventh to be green as Leeks, and paint the skin and hairs half green.

The Nurtree Caterpillar is of a pale green, except three black spots between the joints, and that horn at the end of the back, and growing as it were on the rump, which receives a fresh roze colour. It especially fits on the leaves of the Hazel-nut whence we call it Curelaris. I saw two kindes of them, one was a full, the other a paler green.

The manifold delicacy of Nature shines forth in these, to which though it giveth them the face of a Moor or Egyptian, yet it affords them a garment that is of changeable colours shining in divers woods and real art; in the forehead, the hairs are knit as into knotty locks, and resemble the tailyard: the like are found in the extremity of their backs. The skin is like the rain-bow, and thines in circles deeply died with purple, which nature hath lined to the sides like broad flats; the hairs bred in the skin, shine like the Sun, and dazzle our eyes in a clear day.

We received two Nenfria out of Normandy, the first had a face of a blewe colour, and the body ridged with white red and gray streaks; the hairs are comely with a golden shining colour. The leffer rolled together is like an Urchin; the head is cole-black, the body is variably spotted with little blewe spots; the hairs resemble a Saffron lute.

This compts the buds of the pear tree, having a black smudged face; the body is adorned with some black red white ridges; the middle is were of the shoulders, and to the end almost of the back, little swellings or bunches arise of black and bleue colour, sprinkled with white spots. The Eggs from whence they breed are a bright bay colour, which is also the colour of the Aurelia, and of the hair. We saw another of the same kinde, but only it had a bunch on the back.

We call that half white, which is by nature yellow from the head to half the back, and the rest white as a Lilly. The belly is yellow and ash-coloured, adorned with fluds, and chequed in the middle.

If you touch the feer of the Nettle Caterpillar lightly with a fading yellow, the figure will differ little from the natural; it hath hard upright hairs growing like thorns, they wound with a small touch; and at first they cause a pleasant itching, but venemous; but after that a pain hard to be endured. Some maintain that it is more venemous than the Pine-tree Caterpillar.
On a Cabbage a Catterpillar breeds with a bright blow head, his body is marked with two yellow branches on both sides; between which a grayish plat as it were seems to be spotted with some black spots: the hairs obtain the colour of the Aurelia, which is ashes colour.

Here we show you two hedge Catterpillars, the greater hath a face Saffron coloured, but that triangle you see in place of its nose, was Lilly coloured: the body is variegated with spots, white, yellow, red and black (which we have expressed) placed in no order; it is rough with yellowish hairs: it devours the leaves of hedges and makes them naked: where at length, leaving a bottom of yarn of counter silk, the draws herself into a case of a bay colour, as into a sepulchre. The lesser hath a countenance blewifh, as also the whole body, except that it hath spots black and white; it hath hairs of the same colour with the former.

These have fewer hairs: namely: Cranesbill-eater Catterpillar, St. James wort Catterpillar, Sayl-yard, Urchins, Bramble Catterpillars; and that little born beafe, which the Germans call Horn-worm.

We have here set down exactly the form and magnitude of the Cranesbill-eater, you must make the white spots that adorn its black girdles of an iron colour; and paint the belly and feet, and the white space between the girdles, with a Leek-green colour, Cameraria tent this to Penninus, with this subscription: A great Catterpillar, feeding only on wild herbs, and is especially an enemy to Crowfoot Cranesbill in the Marigots.

The body of the Sayl-yard is various: from the head to the third incision, you would say he were smeared with chalk, in the five following with any dark colour, and on the three half with white lead; the hairs are made of hairs as it were placed together, the lie stand up at the end of his back like a crest: Those four tufts on the back are made of hairs also growing in order like to teeth.

St. James wort Catterpillar, or that which eases the greater Groundel; with the head and feet of a decayed purple colour, the belly of a pale green, hath the body of an unpleasant fading green, and adorned with black yellow and fiery coloured spots; the colour of the hair agree with the belly.

I have observed two kinds of Urchins, one of a blewifh green, the other a mingled white.

The first of the Urchin Catterpillars hath a chequered body, varied with black and yellow; the thorny bristles seem yellow, when Autumn comes it is transformed into an ashly coloured Aurelia.

The second is perfectly like an Urchin, half the back, namely the first half, is black from yellow, the latter is white from yellow; it hath pricks very sharp and thick, of a grayish colour.

Nature hath painted the bramble Catterpillar ashly black, on both sides with three ridges of a pale yellow colour; the hairs are very thin, and altogether black.
Chapter IV.

Of the original, breeding, nourishment, and change of Catterpillars.

Dear book, the faithful witness of my pains,
Let not the purple red thy fair cheeks stain,
Whilest I in tables paint the rude worms race,
And such as change their skins into a cage.
For these by Gods wise hand created are;
Which in small things is wonderful and rare;
And more to be admired in Worms, than Whales;
Or Elephants, Leviathan with scales;
Arm'd as with harness, strong as iron bars;
And roars like thunder terrible in wars;
Who drinks the seas, and spews it up again,
Compar'd with worms, will be admir'd in vain.

So I shall begin with our Poet, who observed a divine power in Catterpillars from their Original; which while't divers Authors have diversly expressed, I know not into how great a
darkness they have call it. Aristot. 5. Hist. 19. writes, that they begin from green leaves of herbs, as from Cabbage, or Rainbow: namely by a feed like Miller left there in Autumn, whence little Worms proceed. From these Worms in three dates space Caterpillars breed at the end of the Spring; which being augmented and nourished sufficiently, they leave off moving, and at the beginning of Autumn they change their form and life to an Aurelia. Pliny that dew thickened by heat of the Sun, is left upon the leaves, whence he derives all kinde of Caterpillars, to whom Arnoldus agrees: others say they all come from Butterflies; which so soon as they come forth of their Aurelia, they shrift forth (above or beneath the leaves hard by) some eggs (the barbarous call them Tarts) and there are greater or less, according to their bodies (some of these have blew sheenes, some yellow, some white or black, green or red) in fourteen dates they are hatched by heat of the Sun, and the shell breaking, they shrift forth small Caterpillars like very small Worms, but coloured: at first beginning they are very hungry, and do nothing but devour leaves and flowers, especially of those herbs and plants where they were left in eggs. But I should maintain that they are not bred only one ways, but all these ways: for though Aristotles doctrine seems to some not acute enough, that the lesser wild Worm grows to be a Caterpillar; yet it is not against reason; for as nature from an egg, so from a worm the producer a more perfect living creature, as perfecting, not as corrupting. For though the worm be not that it was before, (as is clear to fence) yet as much as can be perceived, it is both what it was, and is now somewhat more; for a Worm doth not dye that a Caterpillar may be bred: but adds a greater magnitude to its former body and feet, colour, wings: to life remaining, it gets other parts; and other offices: so off-parts the man (I mean Sculigers words) after some dates at first of a man in puf, is made a man actually; you must understand its generation, in which time the intellecfive soul doth not yet act, but it bears the same proportion to a man that shall be, as a Worm doth to a Caterpillar or Bee. So also Pennius decided the opinion of Pliny, when he witt that Caterpillars we e bred of dew, yet all Philosophers with one consent agree, that the more imperfect small creatures are bred of dew. And not without cause. For the Sun by heating acts, being like the form, and the humour is like the matter. The Suns heat is different from the fire, for it gives life, and it preserves the fire in their likenesse. For the dew hath the proportion and softness of the air, where Theophrastus alledgeth the affect of softnes (in his Book of Plants) as proper for generating air. Alfo nothing is more nourishing than dew by which alone some little creatures live: which also the divine Poet said; How much doth dew lay up in the night! Therefore as it is humous, it is the matter, as it is thin, it enters, as it is drawn by the Sun, and concocted, it is the fitter for generation; for the preparation of the form carries the matter along with its, and these going together it falls out that a living creature is generated. And it is not only an off-spring of dew, but the daughter of Butterflies, as we said, and as experience testifieth: and the greaft part of Caterpillars come from them, besides the Cabbage and Vine-fretters, few are bred otherwise. For these that the Greeks call ήμενε are made of dew, or a humour flat up in beds and purifying, especially when the wind is East, and the air warm, that hafkes corruption. For then in a mighty army of them breaks forth in our Countrÿ, that we cannot truly say or think so many could be bred any way but from corruption. They are all glutinous devourers of herbs and trees: whence Philip the Parthian boasts of himself in Athenaeu in his Pythogical, for feeding on Thyme and Pot-herbs, I am a Caterpillar. Martial speaks to the same purpose; One garden will hardly feed a Caterpillar. When their time of eating is over, they wander up and down here and there hungry, and by degrees growing lean with hunger; some within, some above the earth, seek for a air places, whee e they are transformed into an Aurelia covered with a Membrane, and hanging by a thread or into a bare cave; if this happen in the midst of Summer, after 24 days the shell breaking, a Butte fly presently flies out: but if Autumn be well spent, the Aurelia lasts all the Winter, and shuts out nothing till the heat of the Spring. Yet all Caterpillars are not changed into Aurelia's, but some are contracted (as Vine-fretters) and corrupt, from whom off-times three blackish eggs fall, that are the mothers of Flies or Camharides: when your Butter-flies copulate very late, they bring forth eggs (even until the next Spring) that have life, (if you take diligent care of them) as it is usual in Silk-worms, whose eggs are fold commonly amongst the Spaniards by ounces, and pounds, Theophrastus distinguishing the transformation of these Caterpillars rightly in these words, in his Book of Plants: First, of a Caterpillar is made an Aurelia, and of this a Butterfly, then of that a Caterpillar again. But whether this Aurelian Chrysalis be a living creature or not, we shall dispute when we come to speak of Insects without feet.

Of the quality and use of Caterpillars, and of their Antidotes.

All Caterpillars have a burning quality and pilling of the skin, and raising of blisters. The most deadly is the Pine Caterpillar, yet they are all venomous, but least of all those that are smooth and without hair. The daughter of Celerus sequens, being at Buzil (Basle Grefier) when

CHAP. V.
when she had devoured some Cabbage Caterpillars in the garden, after much vomiting, her belly swelled, the swelling troubled her many years, and no cure would be found for it. William Turner a Divine and a learned Phylician, the happy father of one Peter who was born to give physic to Physick it self, prescribed a purging potion for a noble Woman of England, by the help whereof the vomited up many Caterpillars, which being swallowed by negligence, had long afficted her with cruel torments; yet we may remember (faith Marcellus Virgilius) that there are beets in the set of the same names, and called Caterpillars, and are far from being poison; and amongst those men that live by the seaside, are the last dish at their tables. We have tried remedies against the mitchievous and venomous ones before, in the Histories of Cantharides, Buprestis, and Pirycocampes, for they admit of, and require the same cure. If you would have your garden or trees free from them, what webs you see hang on the naked boughs you must sweep off in Winter; for if you let them remain till the Spring, they will breed before you can remove them. In a short space they devour all green things, and consume the flowers; some amongst their trees with the gall of a green Lizard, or of a Bull which as it is commonly reported, they cannot endure. The Countrymen use to little them with some brimstone and straw let a fire under the trees. The earth dug up under the root of the great bearing nut tree, if it be thrown in a garden, drives away Caterpillars, faith Hildegard. I should pass over the Remedy Columella hath prescribed, as a shameful delusion of Democritus, did not Pliny and almost all the rest approve of it, who meddle with husbandry: the words are these:

But if against this plague no Art prevail,
The Trojan Art will do's, when others fail.
A woman barefoot with her hair untied,
And naked breasts must walk as she cries,
And after Venus spared the most surround
Ten times, the garden beds and orchard ground.

When the bath done, 'tis wonderful to see
The Caterpillars fall off from the tree.
As salt as drops of rain, when with a crook,
For Aconite or Apples the tree is shook.

They touch not Plants that are besprinkled with Wine: Theophrast. They presently dye with the smoke of the herb flora. Artium. Hence it appears (faith Silvius) that the vulgarly called Scabions, is not flora. The Cabbage is free from Caterpillers, if it be fenced with Vetches. The Worms found in Fullers Teseils, make them fall if they but touch the Cabbage Caterpillars. Pliny. Srew your Cabbage with Nitre, or salt earth, whilst it hath lost but three leaves, or strew it with ashes, and by the saltneis of it, it will drive away Caterpillars. Gespon. Palladus in this matter prefers the Fig-tree ashes. If Crabs or river Crevils, were hanged up and exposed to the Sun for ten daies, they will drive Caterpillers from Pot herbs. Cardian ou Palladus. Others wer the feeds just before they get ther, in the blood of a Caterpillar, or the juice of Marramot, to free them from Caterpillers. A tea Onion set or hung in a garden, hinders the Caterpillers from breeding. Some low Mints, others Vetches, others Wormwood about their gardens to drive away Caterpillers. Some not without caufe, have Coleworts and Garlic leaves in theirs gardens, by the humane whereof spread every way the Caterpillers fall down. Palladus, where any man may easily-read of many remedies against them. If a Horfe devour them, swellings arise, the skin of him grows dry and hard, his eyes hollow, faith Hercules, and he prescribes this remedy: You must take the sharpest Vinegar and Nitre three quarters of a pint, Vitriol a fourth part; mingle them and anoint the Horse body: be careful that it enter not into his eyes. Now we shall speake of the use of them in Physick, and in the Common-wealth. The Caterpillers web and covering (like to folk) being drank stops a womans courtes. Math. If it be burnt and put into the nostrils, it stops bleeding at the nose. The Caterpillar feeding on Privet, doth not only in a strange manner allure the Carp, if it be put on the hook for a baits, but also the dung of it put into the nostrils, preferently helps the falling sickness in women, that proceeds from the Maris; as I was told by a Midwife that was very experienced, and worthy to be believed. The Caterpillers that are upon Sponges (in the opinion of Hippocrates) are very good for purulent wounds, especially if they be dried in the Sun, with the double weight of pounded Worms, and adding a little Annice, bringing them into powder, and infusing them in the best white Wine, and so giving them to drink. But heavines following in the belly with numbness, let the Patient drink a little water and honey after it. Hippocrates, lib. de saperata, prescribes these ordinary Caterpillers that are in troops to be given in drink against the Quinsey. Dioscoris, lib. i. cap. 50. But unless they do profit by their secret quality, I think they are to be rejected for their open quality, especially in that disease. The Germans know that the hairy Caterpillar dried and powdered, stops the flux of the belly. Nicander also utter them to procure sleep; for so he writes. And Jeremy Martinus thus translates him:

Stamp but with salt those Worms that eat the leaves
Whose backs are painted with a greenish hue
Against your body with't and whilst that cleaves,
You shall with gentle sleep bid cares adieu.

There are in prickly and hairy plants, such as the Nettle is, some downy and hairy Caterpillers, by tradition are held to cure children, when they cannot swallow their meat for straight
nests of their jaws. A Catterpillar that lives on Pot-herbs being bruised and anointed where a Serpent hath stung, is very good, *Avicen.* If you rub a rotten tooth often with a Cabbage Catterpillar, it will soon fall out of it *self*; faith the same Author. Catterpillars mingled with Oyl, drive away Serpents, *Diogen.* If you anoint your hands or other parts with the same Oyl, it will keep them from being hurt by Wasps or Hornets. *Acetum. Pliny* citeth many superstitious things from the opinion of Magicians concerning the vertue of Catterpillars; which because I see they are call’d forth of the Schools of Divines, and I in my judgement do secretly disavow them, I will not repeat them here. They are meat also for divers Birds that we eat, and are useful for us, as namely Coughs, Starlings, Peacocks, Hens Thrushes, to say nothing of Troues, Robin-red-breasts, Tenches, Carps, Pikes, which are easily deceived by a Catterpillar bait. And if you desire to know the ways of deceiving them; see *Terentius in Geopon.* who is there (that I may not overpa’s the Physick of the soul given by Catterpillars) that hath not sung of Gods mer¬cies shewed to the wandring *Israelites,* when all *Egypt swarm’d* and was even drowned with the deluge of them? Alto amongst the *Romans* there was twice in one Summer such a cloud of Catterpillars, *Anno 1570.* that put them in great fear, for they left no green thing in their fields, but devoured all. Though the fruitfulness of the next year did blot out the memory of this griev¬ous punishment, yet we may not doubt but it put many of them in mind to lead better lives, God grant that we may escape by being corrected in the punishment of other men. Let us think no creature of God to be contemptible, for God can, if he pleases, make the smallest the greatest judgement.

CHAP. VI.

Of the Whurlworm.

The Greeks call it *Sporadus,* which *Gaza* interprets by *Verticillus:* *Pliny* changeth not the Greek word, but calis it *Sphondylam,* the Germans *Engelri,* as *George Agricola* teareth. *Geisser* writes it was called *Tracer,* because it goeth diversly with fawed feet. The Northern English call it *Anower,* the Southern, *Whurlworm,* that is, a *Whirl* or little hairy *Worm* with many feet; *Vincentius* calls it *Zvawcales,* because it hath guards; *Pliny* was in an error, that makes this a Serpent, since the kind of life and reason it left numbers it amongst Insects. Should I here add the differences between *Gaza, Pliny, Theophrastus, Aristotle, Plowman*, and the Schola¬list on *Aristophanes,* and *Erasasmus,* concerning the nature and form of this Whurlworm, I should indeed trifle, and rather bring fire to quench this fire amongst wits, than water. But I rather collect out of their diversions, that there are two kinds of Whurlworms; one about hou¬ses, another in the fields. For so *Aristotle* and *Alcimus* write. *Spathinus* is like to the Whurl¬worms that are about houses. For faith he, your house Whurlworms copulate backward, and that in our sight, as Beetles do, the male coming upon the female, and they stick long in copulation. Away then with these trifling of *Pliny,* that would have thee to Serpents, which never copu¬late backwards. *Hefcibius* and *Favonius,* that follows him describe them thus: *Men say that the Whurtsworm is like to an Insect called Siphium,* making a smell, *if any one touch it. But Ari¬stophanes* and his Scholiast paint it out thus: *A Whurrworm is an Insect like to a Blood-fucker.* *Cameronius* of *Aristophanes* faith, a *Whurt is a worm like a Leech,* smelling most strongly. Whence I collect that there is a house Whurt like to *Siflinus,* and smells so scurily, which if you touch, runs away, and thinks for fear; for so *Aristophanes* hath it, *opim.* As the Whurl flying from you breaks wind singingly. In which verse I cannot but wonder that *Erasmus* (I know not by what Articilm) calls the Whurl *Telem Chil. Adag.* 3. cent. 7. *Pliny* faith it is a very small body, and blackish, which it is be touched while it lives, and after it is dead, sends forth a most terri¬ble smell. I confess ingenuously, that I never yet saw it nor know whether it be by a contra¬ctery in our land or climate. Concerning the field Whurl, we read thus in *Theophrastus* as *Gaza* hath interpreted, of small wide creatures that are bred outwardly, that is not in the roots but without them, none of them will feed on roots except the Whurl, and that leaves none un¬touched; for it is the proper nature of this Insect, *George Agricola* a most learned Philosopher, writes thus of Whurls that feed on roots: The Whurlworm is found under the earth wrap’t up next the roots, (which truly I could never observe) and hence it hath its name *Spathyle* from a little where or whurl. It is so long and thick as one’s little finger, a red head, the rest of the body white, but that it is black above, where it liveth when it is full. This Plague of Or¬chards, which wants not feet (for it hath six feet) and doth not creep, eats up the *pils* about the roots of young trees; nor doth it at all forbear the roots of wilde Cucumers, black Chameleon, Centaury, hogs Fennel, Birthworts, Bnony, which no other Insect whatsoever will touch. This Whurl without all doubt is the Insect that *Malthus* in his Book of his filthy Exorcisms brings in these words: There is, faith he, a certain worm which the Germans call *Engar or Ingar,* it liveth under the earth, is so long as one’s middle finger, of a white colour, a black head, six feet, which by turning about, furrowing and turning up the earth, and eating the roots, makest plants barren.

The
The third year after its generation, it breaks forth like flying Pismires, which like their predecessors stick about trees, and confume the fruit. Then they call it a Whirligig. In the Diocletian's time there were such multitudes of them, that all remedies were attempted in vainly, they were driven away by charms (for so Miltius reports) Cordus also speaks of them. Spodoptery are worms under the ground, the Germans call them Engar or Ingar, called so from the Greek Ἠγέρον, Ἴγαρον.

The next year after they are bred, they are always transformed into May Beetles: they hurt roots much, and feed on all kinds, (be the bitter or venomous) of young sprouts, and trees roots, so that suddenly the whole plants, or at least the leaves shall fade. When the Gardners see this, they dig about the roots of trees, and fetch forth their Worms and kill them. They do us most hurt in the months of April and May; in July and August many are found with us in marish grounds, but there are no May worms but in Devonshire and Cornwall, and in the west of England. This we must note diligently, that it falls out with Insects as with Plants, that they change their colour with the climate and the earth. I have seen and I have by me a Whurl like a Caterpillar, that is of colour white from Ash-colour, with a black head, if it be touched it collects itself into a ball and it fully resembles the Whirl in a woman's spindle when they spin; whence it hath its name. It is bemumped out of the earth, and cannot endure the air; being wounded, a moisture comes forth of a pale black, whereby one may write Letters as by enamelling. I have also a reddish Whirl that lives in the earth two foot deep, whose head is exceeding black, his mouth forked, the neck is reddish from yellow, the back is carter dye, the fix forefeet are red-led colour, and all the belly and the whole body are perfect yellow but that on both sides near the belly there are eight red spots, for ornament. It is long as one's middle-finger, and Summer coming, it is transformed into a Fly. I have seen one also clear coloured, with a thicker body, bloweth from the middle of the back to the tail. But from the neck it appeared more grayish, the head and feet were yellow, the mouth was forked and red: whilst it is young the whole body is white; in age it grows yellow and blew, and it begins from the tail. It is wonderful how it will carry its body long and broad waies by a waving motion, and yet never change the place, and in moving it often changes colors. For whilst it lies on the earth it is all white, but when it is forced to move, as if it were angry, it appears black and blew. It is altogether like to the great Worms in wood, as for the form of its body, but they cannot wreathe and twit themselves round. I have seen a great Fly bred from this Worm that hath four wings. We have another that was found at the roots of Onions; and almost of the same magnitude with the black and blew one, with a green head, and fourteen feet; it hath horns, and a tail green from white: the whole body is green, white, blood red, noted with mingled colours; we call it Onion Caterpillar, we here represent the figures of them all. Now we shall add the opinion of Ioseph Cattermarius concerning Whurlis, whose judgement I always commend. It may be, faith he, Whurils are those Worms that are found in the earth at the beginning of the Spring, that are almost white, or rather somewhat black and blew; which in Autumn become dark green, and with a shining skin, are coloured with a dark dye: their head is a light blue enlining to black, and something hard, that it can easily gnaw roots. Catterpillers soon rowl themselves up and die, and take other forms of Flies or Catterpillars. They are a finger thick, and an inch and half long, they have eight feet in the middle of their body toward the head. Our Countrey call them Earthworms. Guandinus faith that Whurils are Worms so called, that like a Whurl they are round about the roots of trees. Also other Worms that are black, somewhat reddish, and have shell covers, with many feet, like the Serpenta (and they seem to be of kind unto its, but that they are rounder, and not so broad) are found in the earth, and are dug out at the beginning of Summer, and roll themselves up the same way, as I said, if any one touch them. They also call these Engerin, in Germany, that are yellow Worms under the earth with a black head, and near to that small feet, but have none in the rest of their bodies. These when they are dug up turn themselves into a round form, and being laid in the Sun they presently confune; for they live only underground and eat the roots of Plants. Who would not account all these Worms that turn themselves round, to be amongst Whurils? See Ioseph. Catterm. But this of the Iosephus upon Aristotle, faith that Whurils are a round
The Beetles, others but firefly tail. Were sufficient. or two him pier; hath. it their remedy, as it is probable: Cordus holds them to be venomous. In Egypt the Scorpions that they call Si- fyles, eat Whirlworms, as Elkan testifieth: but we shall pass from these to those called Staphylini.

**Chap. VII.**

**Of a Catterpillar called Staphylinus.**

Gaza translates Staphylinus, a Partinip, either by sleep ye carelessness, or rather ignorance; but as it appears in the their expositions of Nicander, the ancient Physicians knew it not sufficiently. For the Scholiast writes that Staphylinus is a little creature like a Whirl: others say it is like the Spanish Fly. Hippocrates speaks once only, but describes it not.

Aristotle treating of the diseases of Horses, calls it an incredible disease, the horse swallows a Staphylinus, that is like to a Whirl. But Abyrtus writes thus: A Staphylinus is like to a Whirl that is about houses, but is greater; it is bred every where in the fields, and goes holding up the tail. Whence I perceive it were no hard matter to know a Staphylinus, if the home bred Whirls were not unknown to us. But that I may do my part and satiisfe my Reader, I will produce two Insects with their figures, which I cannot tell whether they may be called Staphylini or not. But that they are not far different from them is more than a conjecture. The first (as you see) is all shining black, not much unlike to Beetles, but the body is more slender and longer. The whole body is two fingers square or somewhat less in length, the tail is with two forks; which while he flies away (for it will fly away and run very swiftly) it lifts up, as it were in its own defence, and thrusts out like two short stings very white: but we never saw it sting or bite with them; and the stings are too small and soft to enter: when he pours out these stings in anger, it pours forth with them a white and thick substancie, but softer than a moist cement. It lives most under ground, yet it is often seen amongst corn above the earth. But I cannot say that it is like to the Whirl that Aristotles or Abyrtus speaks of. The country people in Kent hold this to be a venomous creature, and that Owen are swolne by this poyson as they are with eating Long-legs. It appears indeed that this Staphylinus is a venomous creature, not only from their report, but by the authority of Aristotles and Nicander. I received the second kind of Staphylinus, a Worm of a wonderful form, from a Nobleman Edmund Knvett, exactly deciphered with his own hand, and they are very common in Norfolk in England. He hath a small head, of a dark colour from red, almost round; the mouth is small and forked. Next the head it hath three feet on each side; the two foremost of them are short (like to Caterpillars) the other four are almost of a bloody colour, four times as long. In the middle of the body under the belly it hath eight feel that are blunt, as also a Cater- piller hath. The tail is burchy and forked with two hair. We learn hence that both these kindes are naturally venomous, because two horses eating hay and swolven them down, were swolven all their bodies over, and died by them. In which disease it will not be useless to know Abyrtus his remedy, that in the like case we may have it ready, and cure our horses. For if a Horse eat a Staphylinus whilst he feeds on hay or ears, he presently calls him out again, by reason of the sharpness of the spirits of it, and as it were Vipers blood. But presently he swells exceedingly. first therefore foment the swellings, largely washing and rubbing them with salt water very hot: then take vinegar Lees, and put into them fine linen cut, and boyli this with water, and anoint him all over: but when he takes his physic, let him remain in a hot house, and a soft flannel.
red well with clothes, and let a good fire be kept continually by him. Anoint him abundantly in the morning, then the third day wash him well with hot water, and dry up his sweat, then rub him in a close place, and having rubbed him, anoint him with Nitre. And fear not though his lips and eyes livid, (for it ueth so to fall out) for the Horse will certainly recover suddenly by this means, and be as well as he was before. But whether these be the fame with Staphylus of Cordus, or the Cniphylles in France let indifferent men judge. They are found in Orchards sometimes to long as ones little finger, and they make hillocks like to Moles, and there they sleep. They chiefly do mischief to Thyme and Elders, yet not so, but they hurt other plants and herbs also. If there be any that knew any thing more certain concerning Staphylus, they are to be desired, for Physick and Philosophy sake, that they will not refuse to add their talent. So at last the natural History of Insects shall be enriched by their labour, and shall repay them not only great thanks, but also their part in a large increase.

Chap. VIII.
Concerning the Scolopendra and Juli.

The Scolopendra and Juli, and Cheesefly march in the last rank. They far surpass in the number of their feet, Catterpillars, Staphylus, and Whutworms, and all kinds of insects, wherein they are called Manyfeet by a peculiar name belonging to them. Aristotle calls this Scolopendra; Theophrastus Scopia; Dioscorides (from the destruction of Serpents) calls it ophiolion; Varicus and Hystoccius call it Amyster phagonus; others, 20.* and some call it Thousand-feet, or Many-feet; the vulgar Greeks call it Scolopera; the Latines also call this Scolopendra and Sepa, and dirty-hog; and hundred-feet, thousand-feet, many-feet; which three last names also they give to Juli. In Hebrew they call it Ghacan; in Arabick Alcempita, and Alamanda, as Silvaticus testifies; Albertus calls it Albamo, Altapa; in the Polish Tongue, Stonogroback, Gaflauka; in the Hungarian Tongue, Zones, Hiragopap, Matzkaia; in High Dutch, Ein naffel; in Italian, Centopee Vermi; in French, Cheville, Milipied; in English Scolopender and Manyfoot. In my judgement it differs as far from Juli as a sea Lobster from a Cow. They are indeed like to one another, but these are alwayes lefs, nor are they so michtieous when they bite, nor so venemous.

The great earth Scolopender is as long and thick as you have it pictured; the colour of the body is black from brown, and shining. To every incision a yellow little foot is joyned, that is, in the several sides sixty. It goeth forward and backward with equal ease. For it goes with the head forward, and with the tail forward; and therefore Ricas and Rhodoginus call it two heads, it hath the part between the head and belly not single, but manifold; whence it comes to pass that this kind can live though it be cut in funder. This Scolopender being provoked bites so sharply, that Ludovicus Armarus (who gave me one brought out of Africa) could scarce endure him to bite his hand, though he had a good glove on, and a double linen cloth; for he strok his forked mouth deep into the cloth, and hung a long time, and would hardly be shaken off.

Another was brought from new Hispaniola, which had on the midst of the back a flame coloured line to adorn it; and a red side, and colour of the hair set it forth. It had feet like to hairs, and lifting it self upon them all, it ran very swiftly; this is worthy of the greatest admiration, that Nature having given to this creature a small head, yet it hath given memory to it, and the rule of reason, not in pines and pitchers, but in the largest measure. For seeing it hath feet innumerable as Rowers, and many of them are from the Rudder the head at a great distance, yet every one knows his own office, and as the head directs, so they all frame their motion.
The Theater of Insects: or,  

Book II.

Another was brought to us from St. Augustine Promontory out of India, something greater in body and feet: which had 70 black and blew incisions; and twice as many light red feet,

I doubt not but more forts of Scolopenders may be found, of almost all colours except green; yet Ardosius makes mention of one that was green. Each of them hath an inbred property, to go to the roots of tword grasses (as Theophrastus thinks). But Robertus Constantinus deliveth to be whip, and doth Stephanus that follows him, and Ardosius himself, who invent that a Scolopender is first a Serpent, then hath eight feet, then a horn in its tails, and lastly, it is a fly goer. Albertus Rhodoginos Aurecens is to be blamed also, who affirm rashly, that no Insect hath above twenty feet, and they put the Scolopender in that number. Yet Nicander calls him two headed in these versets:

The Scolopender hath each end a head;  
And flings with both untill that men be dead:  
With feet like ores he walks himself along, &c.

Yet by the favour of so great an Author, I might say that he hath but one head; though he can as easily move forward or backward with his tail conducting him, as with his head. And this I believe deceived Nicander and others. But he faith farther, that he bites at both ends; which is as falfe as the former; for he bites only with his forked mouth, and hurts not with his tail, otherwise than by a venemous touch; and by putting forth poysonous blood.

Oppinus holds it to be more fierce than the fest Scolopender, and so it is indeed: and I greatly wonder that Gervinus Parvissifus, upon no authority, in his Book of Venomes should oppose this.

All Histories testify that this creature is dangerous and venomous, and so much the more as it is more hairy. We read in Aelian that the Rhytistis were driven out of their City by the multitudes of these creatures: and Theophrastus affirms the like concerning the Obierites in Phleg: therefore though we have ranked the Scolopenders in the last place, yet in executing divine vengeance, they may sometimes challenge the first place. Courteous people do judge of fair weather by the frequent coming forth of the Scolopenders; and when they hide themselves they forecast rain, as Marcellius Virgilius hath noted on Dioscorides. They have these uses in Physick. If they be boiled in Oyl, they take off hair with a little pricking, Gal. 11. Simpl. and Actius lib 7. They are enemies to Wigs; these are most flinking creatures, and kill them with their breath, or eat them alive. Again, Wiglce being either taken inwardly, or anointed outwardly, are a remedy for their bitings, by a reciprocal; and as it were emulating antipathy, as it is manifest from Phleg and Ardosius lib. 6. concerning poisons. When the land Scolopender hath biten, the place is all black and blew, purpled and livelled, and looks like to the dregs of red Wine, and is nicerated with the first bite. Ēgineta. Actius adds that the pain is intolerable. Dioscorides faith the whole body pricks. All hold that this bite is incurable, and will admit almost no remedy. It hath (faith Anazarbus) symptoms, prevention, and cure, the fame as for the stinging of a Viper; lib. 6. c. 23. Against this disease some things are taken inwardly, some things are applied outwardly.

Amongst inward Remedies, Ēgineta commends Trifoly that fmelts like Bitumen, drank with Wine. Dioscor, approves much of wild Rue, the root of Dragons bruised, the root, seeds, and flowers of Aphodilus, the branches and leaves of Serpol, Calaminth, the roots of Fennel and Birthwort, given with pure Wine, or Wine and Oyl. Altharius gives Nix with Wine. Pliny commends Salt with Vinegar, or rather the froth of Salt as being the better. Also he highly efeems of Hogie-mines, or wide Penntroyal taken in Wine. Actius bids give Wormwood and Mins with Wine.

As for inward Remedies, first charifie the place hurt, make deep incision, and draw out the venom by Crippping-glaizes; then put in the juice of the Ieffer Century, boyle with a third part of sweet Wine to the confidence of Honey, and binde a leather over it for eight or fourteen days. Then foment the place with a springe dipt in hot Wine, and this is a certain cure for the bite of a Scolopender. Anonymus. Pliny also prescribed divers remedies for it, as the dregs of Vinegars, walshing the place with Vinegar, the flower of Miller with liquid pitch. Butter with Honey, the green Figs of the wilde fig-tree with Vetches and Wine, the Urine of the patient hurt, and of a Wether, burnt Salt annointed with Vinegar and Honey, wilde Penntroyal with Salts, Salt with Tar and Honey, wilde Cummin with Oyl; and all kinds of Maiden-hairs. Dioscorides commends Garlicks, with Fig-leaves and Cummin, and with Vetch Meal and Wine, also the leaves of Calaminth, and burnt Barley with Vinegar; also he commends a Fomentation made of
Of lesser living Creatures.

The kindes of the Juli follow next; which the Greeks call Ῥαβδιας and that as I think not from their down, but from the tails of Walnuts and small Nuts, whose hair being faftned in a hard substance, represents thee Cats-tails, whence they had the names of Juli. I know the Latines call them Julis, but I should call them Galley-board. For Lyconphon called the Galleys of Paris that were fitted with many oars, Λαμβάνεις. Nicander applies the same similitude to Scolopendres; whence it may easily appear that Juli and Scolopendres are like one to the other. The Spaniards call these Centopias; the Italians, Cento gambi. It may be the English after me will call them Gally-worms: Numinibus also called earth-worms black Juli, as Athanenus witnesseth lib. 7.

Black Juli that feed on earth are called the earth's bowels; yet unlesse they have many feet, they cannot be numbered or named amongst the Juli. Juli are as I said, short Scolopendres, that for the number of their feet, exceed not Hoglice, and all Caterpillars, but also all other Insects. Some Juli are smooth, others hairy. I saw a smooth one in a Cabbage Latice as thick as a small river bulrush, and of the same magnitude; and that it was here: it had a very black head, the back was of a golden colour, the belly was silver coloured from gray, the inclusions and hairy feet were so many that they easily overcame both the eyes and memory. The second was all black, except a white line, which was drawn down the back, straight from head to the tail. The third was a decayed yellow, his head and feet were red, the failyards, and the hairs growing near the tail, were black and blew. If you paint the fourth with a body blackish red, and his feet and failyards lighter, you have righty set him out: we caught some of these coming forth of moss growing on the banks of trees, and others lurking under trees and rotten logs. I could meet but with two hairy ones. The first was white of this form and figure; it crept on a wall, the short hairs that grew on t were black. The second had a black and blew with belly, and a back spotted with an uncomely yellow. The mouth was red, a black eye, the hairs were hoary. It lies hid in old decayed trees between the bark and the wood; and also amongst stones that are overgrown with moss and thick downy hair. All these Gally-worms, if they be touched roll themselves up, and become round. I cannot tell whether they are venomous or not, but if they be, Happy Bennius, who divers times with his bare hand provoked and killed them, and yet was never bitten nor hurt by them. George Agricola tells us of a Gally-worm of a brazen colour (but he calls it a Scolopender) his words are these: A little Scolopender is bred and lives in the logs of trees, or in pots driven into the earth, (whence it hath its name) remove thee or flir them, and it will come forth; otherwise it isways lurks there. It hath no feathers, but hath many feet: when it creeps it lifts up the middle of a body like a vault: if you touch it with a little wand or any other thing, it rolls it self together. It is of a brazen colour, a slender body, not broad, but three fingers long, or at most four.

Also it is found in another form, almost in the very same places, with a slender round body, the thicknes of almost of a thread, of an allied bright bay colour, the feet are so many and so small, that it is impossible to number them. It is four fingers broad in length; it remains under rotten trees and planes. Avicenna makes the Scolopender (which is also a Gally-worm) to have 44 feet only; and to be the palm of one hand long; so small and slender, that it can creep into the cars. Lib. 4. Fen. 6. trait. 5. cap. 19. This creature, faith he, hath no venome, or but very weak; and causeth no great pain: which is presently taken away with the flowers of Alphodis or with Salt mingled with Vinegar. Our Gally-worms (faith Glycer) if they be in the houses, they will come together to St. Thomas Sugar, that is the most pure, (as Mice do to the best Cheese). Our Countryman Bruenius (a skilful and laborious searcher of Nature) reports that he hath seen here in England Scolopendres, and kept them, that shined in the night, and in mossy and broody grounds shined with their whole body: who was no fire, and I willingly give credit to him; and so much the rather, because Ovidius faith he observed the fame in new Hispaniola in the fields, and Cordus did the like in Germany in mossy cellars. It seems strange that Plutarch relates, Lib. 8. Symp. problem. 9. that a stripling at Athens cast up a small ragged creature, together with a great deal of seed: it had many feet, and walked exceeding fast.

The Galley-worm found in cellars, burnt to powder, doth wonderfully provoke Urine. Mr. The Use, vula. The blood of Galley-worms, with the moisture pressed out of Hog-lice, is a divine and excellent remedy to take away the white spots of the eyes. Arnold. Brev. 1. cap. 18.
And thus much for Galley-worms, concerning whose Nat"ures, I pass over the opinions of Hesychius, Aristotle, Nicander, Lycon, Ardosius; because they are various, but not true.

### Ch. IX.

Of Chileps.

Aristotle calls them ἄφες, the Greek Physicians, αἷμας; Theophrastus, ἀγαλματικαὶ; Dioscorides, άγιος ἔρευνας; those of Asia called them αὐραμές, from the likeness of a Bean, faith Galen for it looks like it, when the Chilphe rolls himself up into a round body. Or, because, as our most learned Cowperman Stafford faith, (who was president of the Minories at Wors- cetter in the reign of Richard the second) they are wont to come forth of the leaves and tops of beans, and to grow from thence. Pliny calls it ἄφαμα, from the brawny hardness of the skin, Others call it ᾳραμες, though for the fewness of its feet (for it hath but fourteen at most) and because it cannot arch itself, it seems to be a different kind from a Scopendry or Galley-worm. Farewel then all those dreams of Galen, Innes, and Pliny, concerning this matter; for we deny that these are Galley-worms. But it is called ἄφας, not from the form or finenes of an Alle, but because it is of the same colour, as Fensius writes: For it is a little creature with many feet, Alle-coloured breeding in moist places. Dioscor. lib. 2. cap. 37. Gal. 3. de loc. offic. & 11. de simp. fac. cap. & 6 Spanius. The Latines call it Affulium, Cuscinum, Porcellum; Pliny said not well to call it Centipèdes, since it hath but fourteen feet: The English from the form call them Somes, that is, little Hogs; from the place where they dwell, Tyler-houses, that is, Lice in roofs of houses: they are called also Thernes, or Joval Lice, from a spirit that was not hurtful, to whom our Ancients superstitiously imputed the sending of them to us. In some places also they call them Choroum, and Chilpius, but I know not why. The Germans call them Elbus Eufelgen, Holzmehlen, that is, Wood-lice, because they are oat-times found between the bark and the tree: George Agripola calls it also Stefflein, and vulgarly Keller Elf, as if you would say a Cellar-hog. The Saxons call it Elfehman from its Alle-colour, as the Greeks, μαυσίς, the Latins, Porcellito; the French, Chlopice; the Spaniards, Galium in the Arabians, Harbun Haureu; Gauda, Schabalschada, Kirren, Gris, and Sylvia. The Brabanders call it Piffe de Snegue. It is indeed a very small Insect, scarce a fingers breadth long, and half a finger almost broad; (I speak of the greater) of a colour wains black, especially that is found in dunghils and in the earth; but that which is under yltes and buckers is a perfect Alle-colour. It hath fourteen feet, seven on each fide: every foot hath one joynt, hardly to be perceived. It hath two short fialyards, that it may prove its way. Being touched it turns it self round or (as Galen faith) into the form of a Bean, whence it was called affumé. The fides about the feet are denued like a Faw. It is bred under yltes, water-velletis, in the pith of rotten trees, between the bark and the tree corrupting, as also under rocks, growing from moisture purifying. Then they copulate, and after copulation they lay eggs (whence comes a worm) that are white, shining, like to small pears; they are many, and heaped up in the same place, as we observed in the year 1583, they live on warm moisture, and pass the winter in the chink, or wall, or secret places of houses. From these eggs first somewhat hard Worms are thrust out, which for some time stick almost unmovable, and are white; at length like their parents, they stick the dew and moisture. They are found also in hot and dry Countreys; but where they remain by the dew of the night and vapours, what moisture was consumed in the day. Galen describes a Chilphe thus: It is a house-bred living creature, with many feet, bred under watry veftis, and dunghils, and if you touch it with your fingers it rolls it self up. It is clear that Aristotle knew it, because he compares a Sea-loufe unto it, when his tail is taken off.

Chilpe are temmre, open and discurs, as Galen hath taught us of Aelopias. They seem contempable to the sight, but they are excellent for diifes of the eyes. Also inwardly (for they are free from all poyion) they are of great use; for being bruited and drank in Wine, they help difficulty of making water. Dioscorides. To which Medicament he adds this: Take, saith he, 2 or 3 Chilpe, boyl them in a little fih picke, & drink of the picke with water in two fimal cups of an ounce and half api"f. Pliny with them for the Stone and difficulty of urine thus: Take Mouse and Pigeons dung, of each half a dram; two Hog-lise or Chilpe bruited, drink it, and the pain will cease, and you shall void either the Stone, or much fmal land. We finde in Gesnis papers, that Marcius Bardisanus affirms the fame: Galen gives them drink in sweet Wine, and so he cured many of the Kings Evil. Aelopias most succésfullly used this kind of remedy against the Althma and short windednes: Take Elariterum four grains, three Hog-lise from a dung-hill, well bruited, and drink it with an ounce and half of water. Gal. 3. 24. 14. Aelopias also, building on the authority of the ancient Physicians, much commends the Hog-lise burnt in the fire, and taken to a spoonful; for by their property they cure Althma. Fullerius and Johannes Agripula make good this opinion by their prouife. Some do rotisfe it in a dish a small quantity of
them into moist white Ashes, and then give them with Honey. 

*Pliny* saith they cure short breaths as being bruised with Athenian Honey, and with little hot water, drank through a reed, that the teeth and mouth may not grow black.  

*Actius* for the same infirmity, gives five or six with Hydromel. And *Marcellus* the Empereur reports, *ib. 35*, that 21 Hog-lice flayed into the said Honey, and drank with water, will cure short windings, putridness, and such as are almost choked, and the Leprosie also, beyond belief.  

*Pliny* writes that they are good in drink for Consumptions, who farther maintains, that a penny weight of them given in three ounces of Wine to drink, will cure the pains of the loins and hips.  

*Alexis of Pimou* subscribes to this; but *Calclus Aurelianus* dislikes this, and the like remedies from Insects; being so perverted from the usualness of such remedies, rather than from any hurt or inconvenience that proceeds from them. Experience confirms that many freth Hog-lice well bruised and drank with Wine, Ale, Beer, or any convenient liquor, or applied but outwardly, can cure almost all diseases of the eyes that arise from any thing growing in them, or growing to them, (except the Cataract) which we observed in the former Chapter out of the Breviary of *Arnoldus*. For a Quinsey, faith *Galen*, &c. they must be lidded with Honey, and the outside of the throat must be anointed with the same. Hog-lice boiled with oyl of Roes and heated in a Pomegranate shell, and poured into the ears that are pains, do cure them. *Dioscorides*. *Gal. lib. sect. loc. &c. Enaur. commanded to boil 2, 3 or 4 in oyl, and to press out the oyl and drop it into the ears of those were, deaf, or had pains or tinklings in their ears. Oyl of Chilipes dropped into that ear is next an aking tooth takes away the pain certainly, that ariseth from a hot caus. *Actius* 24, 27. Some mingle them with some convenient unguent and drop them into the ears. *Severus* (faith *Galen*) poured them into ulcerated ears with good success. *Faventinus* prescribes 21 Chilipes boiled in lowr Oyl, for pains of the ears proceeding from cold; in which he shews that they must be anointed about the ears, and a little must be dropped in. *Curdam* justifies the same remedy by experience. For Wens, *Pliny* takes a fourth part of *Rolin* or *Turpeniente* to the danghi *Chilipe*, by which Medicament (faith he) swellings under the ears, Kings-evils, and all such tumours are cured. *Marcellus* *Empereur* hath the same, and *Avicenna* 2, 2, cap. 739. and from the authority of others, he adds, that Chilipes taken in drink, cure the Cramp, and Alcures, which we have never known any to have fail besides. If you often apply Oyl or Butter of Hog-lice to a painful head, you shall cure the pain. *Gal. Enaur. 2, 91. and Aburins de quadrup.* Bruised, they cure the Tonsils, and the displeases of the chops, *Dioscor*. A live Chilipe laid to a whitooscuris it, and it takes away swellings, if it be laid on with a third part of Rolim or Turpeniente. *Pliny*. Take *Uniguer* populion 1, ounce, Oyl of Roes wherein Hog-lice have been boiled 1, ounce and half, Saffron 1 grains, mingle them and make an unguent, that is a most noble cure for the Hemorrhoids, that swell and are painful. Others (faith *Alexandrus* Benedichus) boil these Chilipes with Fat or Butters, then they put to it the yolk of an Egg; and with this they assuage that cruel pain. *Pliny* saith, they cure all hardness of wounds, and Cancers, and Worms in Ulcers, being mingled with Turpeniente. And to conceal nothing from you, I thought fit to add, that *Pennis*, himself lying sick of the Afflimes, used for a long time Hog-lice steeped in Wine; but having done it always to no effect, by my advice at last he did twice or thrice take in the smoke of Brimstone through a tunnel, and he grew perfectly well from that horrid symptom. Take oyl of Violets 11, ounces, wherein let four Chilipes boil till a third part be consumed; it restrains a fall humour, being outwardly anointed. *An uncertain Author*. Hens, water Lizards, Land Frogs, and Serpents feed on Chilipes, as *Theophrastus* writes. *Ambrose Parasus*, a Chirurgeon of Paris, relates that one vomited a small living creature like to a Chilipe: and such a like thing *Solenia* hath written concerning a certain woman, upon the second Book of *Actius*.

---

**CHAP. X.**

Of Land Scorpians.

It is called *oikuros* in Greek, from scattering its venom, or as others will have it, because it creeps lame-ly. *Alfo* *De* signifies a Scorpion, or a kind of Scorpion; whereas *Nicander* speaks in his Theriacs, the burning Scorpion must be pressed down when he creeps upon his feet, being a deadly creature. It is doubtful whether this be a kind of Scorpion; it hath legs or claws, and a sting in the tail. The Latines call it *Scorpius*, and *Pliny, Scorpius Cicerius, Plautus, Varros, and Nominis*, call it *Rapam*, which name *Collineta* ninth often. In Hebrew it is called *Acros*, and *Capharab*, because it pricks those that tread on it. In Arabick it is *Natrab, Athrab, Nicharab, Hakarab, Acerb, Rashi* calls it ٠٠٣. *Couches*
Couches, Pandalarius, Satelles; in Spanish it is Escorpio or Alacranc; in Italian, Scorpione, Scorsifile; in High Dutch, English, French, Brabant, it is called a Scorpion; in the Scyrian language, Niedaradeck; in Illyrium, ifir: in Danish, Wellcovan; in new Hugniola, Alacranc.

But that which hath a bunch on its back and draws the tail after it rolled up, Silvanicus calls Algaratas. It is an insect with a body of the fashion of an egg; as it were smocked all over; at the bottom a tail comes forth, joyned with many round knots, the last as it seems longer than the rest, so that only is armed with a simple or double fling, and fomereth bended backward toward the end: it hath eight feet, and legs forked with claws; and strong piniers; it hath a head at the others have, lying hid in the top of its breast, wherein you can perceive very small and almost no eyes, that Authors do scarce mention them. All Scorpions have tails, or no tails. Some of the tailed Scorpions are fenced but with one fling, but others with two; yet they do not differ in kind and nature. Nicander describes seven kinds of land Scorpions. The first is white and not deadly. The second (faith he) hath a red mouth, from whose fling ariseth vehement heat, feverishness, and intolerable thirst.

Alban faith the same. The third is wand and blackish, whose fling causeth a flaking palie, and a Sardonian laughter and vain; like to that of scutels.

The fourth is of a colour inclining to green; this is soon as it hath flung a man; a cold and shivering poifeth him, so that in the hottest Summer he will fuppoie himself covered with froth. This kind hath many knots between seven or nine, which is also the cause that he wounds so deep, by reason of the length of his tail. The fifth is black and blew, or of a pale colour, of a large stretched out belly, for it feedeth on grails, and is un BASatable. It not only flings with the tail, but also bites with venom'd teeth. Nicander calls its poifon Scorpion, because a Bubo flieth on a man that he flings. The sixth is like to a marled Crab, yet not without a tail, but with a greater body and almost round, so that it represents a Crab with a tail. Matthias faith that he faw of this kind some that were black, murrey and green in the County of Arcinus, not far from the River Sarus. The seventh is like a Grampel: also it hath claws greater than that; and this kind is produced by Crines on the dry ground, that are rent in some hollow places to escape the Fishermen: in which places if they die or corrupt these kinds of Scorpions grow from them: as Ovid most elegantly hath set it down:

Take off the claws of Crabs that nfe the flores, And from their bodies with earth covered ore, A Scorpion grows threatening with crooked fling.

Alban calls this the flame-coloured, for it is like the Crab that becomes red by boyling. There is another kind of Scorpion which we call Rhab- fis, and the Arabians Scorpion; for Nicander and the Greeks never say it; it is very banchy, and runs twifteft of them all: it hath a tail for its small body that is very great: it seems to be pale, but the fling put forth is very white: Rhabis calls it faraves; Alonchis Grati; Aviceenas, Algaratas. It is found in the Eastern Countries, especiaily in Cys and in Hafcaris, as Gordius notes. Philosophers say that the flings of other Scorpions infufhe a cold poifon: the Arabians say that only this one, intueth poifon that is hot. I saw one brought forth of Barbary, and we here give you the picture of it. The fling of all the tailed Scorpions is hollow, whereby they call poifon into the wound: as Alban reports, l. 9. c. 4. To which Pliny subscribes, lib. 9. cap. 37. and Nicander in his Tho raricks. Yet our Galen is of another minde, lib. 6. de loc. aff. e. 5. where he speaks in these very words almoft to those who ascribed a specific quality of hurting or helping to humours or vapours. But the fling of the Scorpion deserves much more to be admired, which in a very short time causeth extreme symptoms; and that which is infufed when it flings, is either very little or nothing at all, there appearing no bale in its fling: And indeed, when we fee that from the teeth pricks and flings of some creatures, fish or plants, there is solid poifon conveyed into the wound by them; what need we fly into secret bladders, and piercance such as were never seen, that lie hid under the root of their flings, such as fruitful wits have rather invented, than solid judgements and those that were judicious for the truth? As I saw, they have all six, besides the claws that are their fore-legs, as crabs have; (which I should more willingly call arms) some of them (if you look narrowly) are forked: their tail consisteth sometimes of 65 or 7 or 9 knotted jointes; in the end of the tail is one hollow fling, two sometimes, (but that is more feldome). If it had its fling any where but in the tail (faith Aristote lib. 4. Hislori) because it moves it self by leaps, it were unmeet to fling with all: Alban faith, that its fling is very small, and scarce visible: out of whose invisible pipe, if there be any such a venomous spirit, or noifter humour is poured in by a wound made, that is faince perceived or sensible. It walks side-ways as Crabs do, alwaies moving the tail ready to strike, that no opportunity may be let flip. The Males are the fiercer, flenderer, longer, and more spotted on their bellies, claws and flings. The Females again (as Aviceenas well observes) are greater, fatter, greater bellies, and milder. The poifon
Of less living Creatures.

of the Male is also more dangerous, as Pliny thought, the Female is more gentle; but all their venom is white, unless Aplidomus deceive us. It is apparent that they which have seven or nine joints on their tails, are the most curi: many have but six, it strikes afteward and bendingly, All of them have their portion more violent at noon day, and in Summer, when they are hot with the Sun-beams, and when they are thirsty and are unfatible for drink. The plague of it seems intolerable, and which with a heavy punishment destroys a man with a lingering death in three days. Their stinging is always mortal for maids, and most commonly for all women: and for men in the morning, before they can cut out their venom by some accidental stroke, and are new come to their hold. It is the property of Scorpions, that they will not sting the palm of the hand nor smooth parts; and none unless they feel the hair. Scorpions, as Pliny tupporeth, wilt hurt no living creature that wants blood: which Dr. Wofius of Turn a most learned Physitian hath proved to be false: for he saw, as he reported to Pennius, a Viper flush up in a vell, with a Scorpion, and they killed one another with mutual biting and stinging. And Aleian writes, l. 8. c. 13, that they do fight and contend with Vipers, and all kinds of veno-

mous Insects for their meat: Gepinc faith it is certain that a Viper will devour a Scorpion: and from thence his bite will be the more grievous. Alfo Thoephratius writes that by the thing of Scorpions Serpents will dye, and not men. But Galen depending on experience, hath proved it to be false; and apprehend it for a lie. Pennius sleeve the fraud of Aleian relating stil. 6. c. 23, the wonderful fraud of Scorpions; but since I observed the same in Italy, I will maintain the truth of the Author, and free him of it. We know that the skill men have in that Countrey, they employ it all to escape from the Scorpions: whereupon they use fands to defend themselves, and hang their beds on high from the ground, they place the props or supporters of their beds far from the walls, and sees them in vessels full of water, and many other inventions they have to de-

cease or to destroy the Scorpions. But the Scorpions get up to the roofs of houses, and if they can finde any lefe broken they will remove it, and one of the strongest of their Captains, crus-

ting to the force of his claws) hangs down by this chink, and his tail hanging down, then anoth-

er upon his back comes down as by a ladder; and takes hold by the other tails, and a third takes of the hold of the second's tail, and a fourth by his tail, and so the rest, until such time as by links they can reach the bed, then the last comes down and wounds one that lies asleep in his bed, and runs back again by the links of his fellows, and to the rest in order: thus away, unloosing as it were the chain, until they are all got upon one another backs, Alfo Clem. Alex.

1. formis. makes mention of this property. But they are not all venomous, no do they hurt or sting all men alike. For they do not live in Sicily, and if there be any there, yet they do not hurt; and therefore the Philis kept their labour when they undertook to free Italy from this mischief that was a stranger to them, in hopes of gain. Plin. lib. 11. cap. 25. Arifotole writes of the fame thing concerning Phars lib. 8. Hisp. c. 29, of the Island Malta. Diodorus lib. 4. cap. 3, of the Country Noricum. Joseph. Stalifer exerc. 189, 5. where you shall come in no place but you shall finde abundance of them, and yet they either sting not at all, or else there is no danger unto men by it. But now in Egypt, Sicily, Africa, and Albania, they wound mortally, as we read in the Books of Alexander de Alexandro. Pliny, Dioclesides, Strabo. In England, Scotland, Ireland and Gaff-

ony, Scorpions cannot live, nor in the colder Islands more Northward. For though they cannot well bear the heat of the Sun by day, and therefore lie under fones all day; yet it seems they want no lefe heat in the night, for love whereof they come not only into chambers, but get into feather beds, and lay themselves down sometimes close to thofe that are asleep. Men report many things concerning the Country of Trent let free from the deadly sting of Scorpions by the prayer of St. Viflium. But is it that the Readers chooe to take it for a Truth or for a Fable. In Scipia it is far otherwiffe, for the e f a Scorpion sting a Man, a Hog, or any Beif or Bird they are certainly killed. Cardan faith that such as wound mortally are feldome bred. But Matthius teckons up an army of desperate fymptoms that happen there, especially in Heterius by the stings of Scorpions, sometimes joined with death. And Aleian l. 8. cap. 13, reports that in Ethiopia men live are not only endangered by the sting of the Scorpions; but if they do but tread on their excrement, their feet blifter, and they can hardly be cured. He calls those Scorpions Sibifita, They feed on Vipers, Blind-worms, Lizards, Spiders, and other veno-

mous Insects: whence they are fo forcible with poifon, and have a kind of gradation (that I may use Paracelsus) in the like of it. Arifiole speaks of some Scorpions in Caria that are very loving to franges, (Aleian reports that this is about Latmus a mountain of Caria, where they are facted to hospital fugiers, and do not sting any stranger; or if they do, they do them no great hurt, but they kill the inhabitants presently when they sting them. A Lion whensoever he fees a Scorpion flies from him as from an enemy to his life: wittens Philelupes and St. Ambrose gives credit to it. Men say that such are never sting by Wasps, Hornets, or Bees, but only are sting by a Scorpion. Pliny. Their General Generation is that commonly Copulation, more seldome, (to far as we know of it) from Patre-to-fian, felifion. Some maintain that they are not bred by copulation but by exceeding heat of the Sun, Aleian lib. 6. de Anim. cap. 22, amongst whom Galen must first be blamed, who in his Book de fas. form, will not have Nature but chance to be the parent of Scorpions, Flies, Spiders, Worms, Nats, of all forts, and he attributes their beginning to the uncertain constitutions of the Heavens, Place, Matter, Heat: but doubtless they do copulate, and they produce little worms alive (which I have
have been) they are white and like to eggs, and they sit upon them to hatch them. So soon as they are young are brought to perfection by them, they are driven away by their young, as it falls out with Spiders also, (especially those are called Phalangium) and they are destroyed by their young ones in great numbers. Scorpions are fruitful creatures, for oft-times they bring forth eleven. Some also suppose that they devour their young (namely Antigonus) but only one that is more cunning than the rest, which hides it left about the damp places, and so escapes the danger of its sting and biting. Thus afterwards revengeth the death of all the rest, and kills its parents from above. They bring forth twice a year, namely in Spring and Autumn. The original of Scorpions from pasture is more rare, and it is many winters. For they are bred from Crevis corrupted. Pliny lib. 11. cap. 25, and from the carasses of the Crocodiles, as Antigonus affirms, lib. de mireb. iij. cap. 24. For in Archelaus there is an Epigram of a certain Egyptian in this words:

The carasses of dead Crocodiles is made the feed,
By common Nature, whence Scorpions breed.

Arrietos adds further, that from water Mints corrupting: Scorpions are bred. And Kiramides and Pliny lay they breed of Basil. An Italian that delighted much in the smell of Basil, a Scorpion bred in his brain, which afterward caused most vehement and long during tortures, and lofty death. Helleurus, lib. 1. cap. 1. of his practice. Geiger heard as much of a French maid, as he tells in his own hand writing. Doctor Banchinus second to none for Anatomy, reported to Doctor Pennius, that he hid Basil in a wall at Paris, and after a certain time he found two Scorpions in the same place. Chrysippus therefore not without cause, dispraised Basil to many men. There are some that maintain that if a man eat Basil the day he is ill with a Scorpion, he cannot escape death. Others say, that if a handful of Basil be bruised with sea Crabs or river Crabs, and be left in a place where Scorpions haunt, all the Scorpions will come about it. Pliny lib. 20. cap. 12. But Diuiformes lib. 2. 135, and lib. 32. cap. 5, faith that Crabs will kill Scorpions, if they be put to them with Basil. Albertus Magn. lib. 19. anim. cap. 18. Some are of Avicenna's opinion that they breed of corrupt wood, and are made many ways. The place conduce them to their generation and production. For in Hispiana, the Canaries, Numidia, Scythia, Pefcar, Barbary, Ethiopia, there are such multitudes of Scorpions, that the inhabitants are oftentimes forced to forake their habitations: Ovidius, Thevetius, Leo Afer, Pliny. The Country about the Lake Arvhitia, in the East Indies near the River Ephemens is so fruitful and so favored with Scorpions, that the inhabitants not knowing what to take, left the place to them. Aelian lib. 17. cap. 40. When you are two days journey from Sufa in Persia into Medes, you shall light upon an infinite number of Scorpions, whereupon the King of Persia being to ride that way, commands the Citizens three days before to hunt the Scorpions, and dadgins a very great reward for those that catch most of them. If he should not do it, by reason of the multitude of Scorpions lying under every stone, there could be no passage. Aelian. lib. 15. cap. 26. The East Indies as Agatharches tells it, and Africa also, breeds abundance and very great Scorpions, which also wound with their stings as the others in Europe do. The Scorpions of America are the smallest of all, yet the most venomous, next to those of Africa: their poison works so suddenly, that it immediately flies to the heart and kills the party that is struck. The people of Narenum near the Alps, have in their Country many Scorpions, but (which is wonderful in Nature) they are all harmless, as Scaliger affirms. In Pharos also, and the Territory of Avarium, the Scorpions (as we said before) doe not hurt. In some places of Heretius (as about Raphioid) there are found very small Scorpions, and innocent. Geiger. So it is also in some Countries of Germany. In new Hispiana there are a great many Scorpions, but not very venomous; there is some pain that follows their stinging, but it is not great, nor of long continuance, and men are more hurt by the stings of Waifs or Bees: unless it were so that the Scorpions were fatting, or newly wounded. Manardus. But the Scorpions in the Island Ferreta (which is one of the Fortunate Islands) and Captum in Egypt, cause great pain, and their Venem is mortal. In Cafile a Country of Spain, the country folk oft-times while they plunder the ground, do finde innumerable Scorpions, clustered together like Pimens where they hide all the winter. Matthias. The colder Countries have no Scorpions, as Gascony England, Ireland, Scotland, Denmark, and great part of Germany, or if there be any there, they are not venomous. Aelian reports a wonderful thing concerning the Priests of Isis, which in科普, a City of Egypt, there are abundance of deadly Scorpions, they can tread upon them, and call them on the ground, and yet receive no harm by them. Alfo Cifis, a people of Africa cannot be hurt nor stung by Scorpions. For when they come to any venomous creature, it presently becomes stupid, as if it were charmed or struck dead, that it cannot move. Alfo all their Hogs, but not the black ones: (for if they be stung they die presently) are free from their stings. Laftly, a Scorpion nor any other venomous beast, doth not hurt a Stellio, an Ascabatoes, a Crab, a Hawk, as Galen ad Pifonom, and our friend Geiger have observed.

Their Food.

They live by eating the ground sand in some places they feed on Herbs, Lizards, Blinde-worms, Whirls, Beetles, and all poisonous beasts. Aelian. But he that shall tread on the excrement will have his feet blistered. The Hens, Ibis, Vipers eat abundantly of them, whence Arisftotle calls the Viper exsanguineus. And they are not more fit for their food, than they are a remedy for
for us. For being laid to their own wounds they made, they cure them, as is generally known. Their use in also a Scorpion bruised refists the poison of a Stellio, Pliny. Some bruise them and drink the fluid, in Wine, cutting away their tails. Others lay them on burning coals, and perfume the wound, and then strew the Scorpions ashes upon it. Some bind them to the wound, being bruised with salt, Linseed, and Marsh-mallowes. Against the Stone, Lanfrancius his Powder: Take 20 live Scorpions, close them in a pot with a narrow mouth, and with a soft fire burn them to ashes, which is a wonderful remedy against the Stone; A Scorpion torridified and burnt to ashes and taken with bread, breaks the Stone of the bladder. Author ad Phisicamen. Three Scorpions closed in a new earthen pot, and covering it with a cover well luted, with a fire made of Vine branches, bring them to ashes in an oven; the Dose is 6 grains with syrup de quinquie radiciis: it wonderfully drives forth stones of the kidneys.

New Authors exceedingly commend the ashes of Scorpions amongst the remedies against the Stone, and the oil of them injected into the bladder, and mounted outwardly. Alexand. Benedicitus Aggregator, and Leonellus Fahrenheitius, out of Galen (Ep. por. 3) teach us to burn three small Scorpions, and to give their ashes in Syrup, or a decoction, or some confection proper for it, to break the Stone. And lib. 2, he bids us to mingle them with fat, being calcined, and so to exhibit them; because otherwise the Patientes would abhor the eating of them, wherefore they may be given without fulpicion. That Medicament of Abolbians, Aridnus praieth so much, is made of the ashes of Scorpions, as you may see in 2. Breviaris cap. 18. as also the admirable syrup of the King of France against the Stone, which is described in the same Book and Chapter. Rondelatius capite de calcino, in his practice, maintains that a Scorpion is cold, and therefore to drive out the Stone we must use the compound, and not the simple oyle of Scorpions, Matthioli teacheth to make that compound oyl; Commentar, pag. 1427. 20. But before him, Luminare Maina, made that after this manner. Take round Birthwort, roots of Gentian, Ciperus, Bars of Capers, of each 3, ounce, oyl of bitter Almonds 3 jilt, let them stand in the sun 30 daies; then add to it 15 Scorpions, and shuffling the veflel again very close let them in the sun 30 daies as before. Then strain the oyl and keep it for your use. Others prepare it thus: Take old Oyl as much as you please, put as many Scorpions into it as you can take in July (for then are they most venomous and fittest for this remedy) add to them white Dittany, leaves of Wormwood, Berony, Vertain, Rosemary, of each, 7, handful, set them a-flaming for a long time, then distil them in balneo in a Limbeck. It is called St. Bernardis Oyl. It powerfully provokes urin. Anointed on the gout, it is prevalent against the bitings of Scorpions, how venomous soever. It drives out worms miraculously, Bfragralis. Of Oyl of Scorpions and Vipers tongues, is made a most excellent remedy against the plague, as Cennisus testifieth, t. 7. Manardus faith that Oyl of Scorpions is now made with old Oyl, adding many medicines thereto commanded against poisons, and it is admirable in the plague, and against all venome. I know a man that having only this remedy, made no reckoning of the greatest plague; and had not only preferred himself but his servants also, whom he sent to visit people that were sick of the plague; and I know very many that escaped only by anointing themselves, having drank the most deadly poisons. So says Manardus. A jiniment of Scorpions against the plague, and all poisons, is described by Euemanesius, lib. de cur. pest. cap. 12. A Scorpion is good also against a wound given by a Viper, faith Galen lib. de simpl. Samaonius commendeth them highly against pains in the eyes, in these verses:

If that some grievous pain perplex thy sight,\[\text{If that some grievous pain perplex thy sight,}\]
Wool we in oyl is good bound on all nights.

Carry about thee a live Scorpion eyes.

After of Colerworts doth make them apply.

Wth bruised Frankincense, Goat's milk, and Wine,

One night will prove this remedy divine.

If any one troubled with the Jaundies take Scorpions bruised in Wine and Honey; Galen faith he shall quickly finde help. Kiranides, against a Quartain ague, Quotidian, or Terram, prescribes a Scorpion put into a glass of Oyl about the wane of the Moon, and kept there; and with this Oyl anoint the whole body on the joints, and the soles of the feet, and the palms of the hands, very well before the coming of the Ague. Plinius secundus faith, that a Quartain Ague, as the Magicians report, will be cured in three daies by a Scorpions four Lift joynts of his tail, together with the gulle of his exs, to wrap up in a black cloth, that the sick parent may neither perceive the Scorpion that is applied, nor him that bound it on. But let these superstitions pass, and we shall speake something of Antidotes against Scorpions.

First therefore of Phyphilisicks, Magicians deny that a Scorpion can pafs over if he be compassed in with a branch of Turniole: and the herbe laid upon him kills him. Pliny. A smoke made with Brimtone, Gilbanum, and an Afler hoof, drives away Scorpions. Rhaps. Take Storks, Arie,

nick, Sheeps-dung; fat of the caul of Sheep, equal parts, dissolve them in Wine, and make a fume by the holes of Scorpions. If a Radish cut be put into their holes, they will not come forth. A Scorpion burnt is good, the live of an Afl, Sandarachis, with Butter or Goats fuet to make a fume. Varrigana and Dioptanes in Geopon. Rhaps commends the root of Elecampane carried about one.}

Men say that Honleek hath a sovereign a might,

Who carrieth but no Scorpion can him bite.

Preventes against the stinging of Scorpions.
If a man anoint his hand with an herb called Paris, or with the juice of the root, he may safely take a Scorpion in his hand, Flamininus. Grapes prefer men from the stinging of Scorpions, as also Filibers carried in their Purse. Aetius. Also the seed of wide Docks either drives them away, or their stinging is not mortal. Dioscoride. Who also stout from the Africans, that Basil will do the like. Larks purs, and wide Camplings also makes them stiff and atrophied: The same Author. And faith be, they report, as long as any man hold Cardius in his hand, a Scorpion will not bite him: or if he do, it will not hurt him, The seed of Wood-forrell drak, preserves one from Scorpions. Aviceina. If you lay Solomons Seal under you, it keeps off Scorpions. Jfdorns. And Plyy learned from the Inhabitants of Africa, that he that carries Radifh-root, or Turnfole, or a dried beet like a Lizard about him, Scorpions will not hurt him: So Dittany in smoke, or while Mints, or Oyl of Scorpions anointed about their holes, will keep them from coming into the Chambers. Rhafis. But these things will kill them laid upon them: Radifh-root chewed, broad leafd Basil that grows by the water side, Millows leaves, black Hellebores (but the white will quicken them when they are dying, if Plyy may be believed) Scorpions grate, Rose-root, Basil with a red flower, the spittle of a cholekine man falling. Rhafis, Plyy, Aviceina Democristis in Geopon. To cure the sting and wound Guilemus de Placenta, prescribes this in general, namely, to give and apply inwardly and outwardly, presently, good Theriac; then the part affected must be cut, and an actual Cautery set to it, and the poiyon drawn forth with Cupping-glasses. Galen bids binde the part above, and to cut off the parts affected, Gal. 5. de loc. aff. c. 5. But since that is a very hard and cruel remedy for the patient, I thought fit to write from the Antients what remedies are cures for this wound. You shall first know the stinging of a Scorpion thus: The place is presently red and inflamed, and by turns, (as in an intermitting Ague) waxing cold, and the sick is sometimes better, sometimes worse. He sweats all over, his hair flares upright, his whole body waxeth pale, his secretes swele, he breaks with hale, his eyes run with clammy tears and filth, his jouyrs grow hard, and he hath the falling of the Tuel, he seme at mouth, he is drawn backywards by convulsions, and troubled with the Hickop, and sometimes great vomiting, he is quickly weary of labors, he is vexed and troubled with fesse of horror, the outward parts of his body are cold a packing pin runs over: all his skin, sometimes he thinks that hail falls upon him; for Galen asking one that was stung with a Scorpion, what he felt, (3. de loc. aff. c. 7.) he said he feeme all covered over and almost frozen with hail. Aetius adde, mumauum, or waris of the fundament like Ams; after thefe pointing, then swelling, and finally death. Aetius writes, that if the lower parts be stung, the goines well felenfely, if the upper parts, then the Arm-pits. The wound being now known and viewed, and opened by section, and the generall cure we speak of applied, whereof Authors are plentiful, Galen amongst outward remedies reckons Balsamum, true Worms wood, or the juice of black Mistle-berries anointed. Alfo he diversly commends the spittle of one that is falling, and uereth it as a Charm, lib. 10. Simpi. And he bids give inwardly the Balsam with womans milky, the Sapphire stone in Powders Afla fatida, Scordium, Centaury the lift, Rue, Califorum. Out of Gaffon the Phisician he commends this: Take Afla fatida, Galbanun, each alone, make it up with the decoction of Scordium, and round Birthwort. The Doe is the bigg-nelle of a small Nut with hot water. Out of Andromachus he commends this, lib. de Theriac. Take Theriac two drams, Wine four ounce, mingle and drink them.

Dioscorides outward remedies applied.
Cyprus bruised and laid on.
Amomum used with Basil.
The Milk of the Fig-tree, or the juice of Sage
drop in the, the Scorpio it lert bruised,
Sow-chitlise beaten.
Succory.
Hawk-wood.
Balm.
Bath-flower.
Mull-berries.
Larks-heels.
The flesh of a Fish called Simarux.
The Barbil Fith cut in two.
A Fish called Laccota salted and cut in pieces.
House Mice cut afunder.

Internal remedies from Dioscorides.
Cardamomum.
Juice of Myntes.
Bay-berries.
Horfe or Afs dung.
Seed of Campions,
Mullens.

Chamelprys.
Scorption-grafe.
Turnfole.
Calantine.
Trifoly.
Scordium.
Lins rafica.
Basil with Barley-flour.
When remeal with Vinegar and Wine.
Marjoram with Vinegar and Salt.
Afis dissolved in Wine.
Sea-water.
Quick Brimstone with Robin and Turpentine.
Salt with Linseed.
Galbanum made for a Plaifer.

Other External remedies out of Aviceina.
Marjoram laid on with Vinegar.
Root of Coloquintida bruised.
Reed roots bruised.
The Shell of an Indian small Nut.
Rams flessh burnt.
Mummie four grains with Barket & Cows milk.
Decoction of Ameoz.

Bran

The Antidote of Andromachus, otherwise Braia, the King of Sicily.

Take Caltoreum one dram, Scordium two drams, Coftmary one dram and half, Afsa fataida three drams and half, make it up with Honey. The Dofe is one dram and half, or two drams with wine.

Another of the same.

Take Birthwort round and long, each one aureus, Cummin-feed three drams, Afsa fataida, Caraway, Rue-feed, each two drams, Caltoreum four drams, make it up with Honey. The Dofe is two drams with the hot decoction of Gentian root, or Birthwort, and wine; he gave also two drams of Afsa fataida and sometimis three drams, Wood Laurell with Vinegar.

A Medicament of Andro a Greek Philosopher.

Take Rue-feed, live Brunifone, of each six aurei, Caltoreum one aureus, Afsa fataida one aureus and half, Pellitory of Spain, liquid Saffron, of each one aureus, make it up with Honey. The Dofe is half an ounce with Vinegar of the beet wine.

Another excellent remedy.

Take Rue-feed one aureus, Caltoreum half so much, Birthwort round and long, of each two aureis, roots of Gentian, Afsa fataida, of each eight drams, or eight aureis) make it up with Honey. The Dofe is one dram and half with pure wine. The Elecuary of Zeno, or Diarura. Take Afsa fataida, bitter Collus and sweet, each five aureis, round Birthwort, Agrick, each two aureis, Caltoreum, Cinnamomum, Aloe, each three drams, roots of Osris, Saccocolla, each one dram and half, long Birthwort, Geranian, each six drams, make it up with Honey. The Dofe is three drams. He commends also the great Theriac of Andromachus, Estira, Mithridate, and the Theriac della fera. The description of it is this. Take Gentian, Bayberries, long Birthwort, Myrhe, each alike, make it up with clarified Honey. The Dofe is one aureus with hot water. Another against the bitings of Scorpions. Take feed of wilde Rue, Ethiopian Cumin, seed of Trufoils, Miminath, each alike, with Vinegar what may suffice, make a Confection. The Dofe is one aureus. Another. Take Garlick, Nuts, of each one part, Rue leaves dried, Afsa fataida, Myrhe, of each half as much, make it up with milk. The Dofe is three drams. Another. Take Caltoreum, white Pepper, Myrhe, Opium of each alike, make Troyches, The Dofe is three oboli with four ounces of wine. Another. Take Opoponax, Myrhe, Galbanum, Caltoreum, white Pepper, each alike, make them up with liquid Saffron and Honey. Another. Take roots of Coloquintida, of Capers, Whone wood, long Birthwort, wilde Saffon, each alike. Give children one scruple, men one dram, it is of wonderfull vertue in this disease. Another. Take green grasefowt juice with Cows milk, boil it like to an Elecuary, The Dofe is two aureis, they say it helps much. Another. Take Opium, seeds of white Hen-bane, make it up with Honey, and mingle it with hotter things to temper it. If any man will have more from Avicenna, he shall finde it Can. 4. Fen. 6. Trait. 3.

External remedies out of Rhasis.

The hot Oyl of Anacardi standing in the shell of an Egg, rubbed in, let the wounded part be first
first bound, then let it loose; and anoyn it with Jefamin Oyl. The third day open a vein; but after meat and sleep. Also anoyn the place with Caltorium, Melanacardinum and Garlick, laying on a plate anoyned with Quick-filver.

Sagpenum applied outwardly, heals the wound; and a Waffels flesh laid over it.

Rub the place with a Toppaz and it will be cured.

The wound is bettered by rubbing a Flie upon it.

It may be cured with water from Radifh-leaves, and Oyl of Miftard-feed, and Marjoram.

Serapis writes that boyled Butter doth good.

**Internals of Rhus.**

Sweat must be procured any way, by external and internal means.

Take Nuts, and Garlick cleansed, of each alike, bruife them.

The Dofe is one ounce, and an hour after let him drink wine. Others add to this a like quantity of dried Rue, Myrthe, and Afla. The Dofe is three dram, with pure wine.

Another. Take Nigella seed one part, Asa three parts, the Dofe is one Trochio, with one ounce of wine.

Another. Let him drink strong Wine till he be almost drunk; and in the morning open a vein.

Another. Take roots of Coloquintida, bark of roots of Capers, Worm-wood, Endive-feed, of each alike, make a powder. The Dofe is one dram, for children one trefpule.

Another Theriac against the flingsings of Scorpions. Take round Birthwort, roots of Gentian, Bay-berries, roots of Capers, Coloquintida, Worm-wood, Swallow-wort, white Briony, each alike, make it up with Honey.

Another. Take Myrthe, Opoponas, Smallage, one each dram and half, white Briony, long Birthwort, Pellitory of Spain; each fix dram, seeds of Rue, Gith, Trifoly, each three dram, Gum, Arabick, what may suffice, with Vinegar make Trochis. The Dofe is one dram to one dram and half. Another. Take Cloves of Garlick cleansed five dram, Nuts ten dram, Afla one dram, incorporate them well. The Dofe is two dram. Another. Take Gentian Birthwort, Myrthe, bitter Cofhus, Rue, Caltorium, wilde Mints dried, Pellitory of Spain, Pepper, Gith-feed, Afla feda, each alike, make them up with Honey, The Dofe is one aureus with wine, Also the powder of Eringo root is good with hot water, and the powder of Dodder, Also one aureus of Napeillus with water. Ivy and Polium with water are very profitable. If a fever come upon it, open a vein, Asfe three ducng drank with wine is very helpful, Thus much from Rhus.

**External remedies from Albucatus.**

Anoyn the place with Oyl of Ben, for many days, or Oyl of Jefamin, grinde Euphorbium with it, and Caltorium, or else Caltorium and Garlick ground together, with old Oyl for a plaifter.

A Frog cut and laid on is very good. Take old Oyl one pound, Wax four ounces, Euphorbium one ounce, melt it in the Oyl, and anoyn the place with it.

**Internals from Albucatus.**

Let him drink hot milk from the Cow with wine or Honey. Cinquefoil-feed, and lees of wine, are Therian in this disease, as also Rocket-feed.

Hierac Anacardina against the flings of Scorpions. Take Pellitory of Spain, Gith-feed, bitter Cofhus, black Pepper, Aconis, of each ten ounces, leaves of Rue, Afla fedo, roots of Gentian, long Birthwort, Bay-berries, Caltorium, Caufa lignes Mutard, Melanacardinum, of each five dram, make up the powders with Oyl of Nuts, and with juice of Radifh-root make it complex. The Dofe is one dram daily, it caufeth Sweat, The brains of a hen in drink is very useful.

Hatif Abbas brings nothing that is new, but only takes other mens preffcriptions, Concerning some Seals (amongst the hundred payings of Prodomy) and some fashions for Charms, both he and Kiranides make mention, but a Christian believes it nor, nor are they worthy to be recorded by him.

Pannitis mightily commends a Plaifter with Garlick and Butter, or to anoyn the place with Oyl of Peter, or pure juice of Leeks.

He preffcribes to give inwardly of the pith of the greater Spurge four trefpules, with warm water.

Rabby Mozof preffcribes one Sextula of Frankincence with Wine sufficient. Also he exhib- its Pigeons dung dried, and finely powdered with Butter and Honey. The Dofe is two Sextulas.

Gnis de Placeatia bids men give drie or green Marjoram inwardly, to drink it with mans Urine, and to apply it outwardly.

Conflantius A. Panceh. lib. commends Hens dung or the heart applied outwardly, and Pimp- petrel inwardly, taken with WIne, and powder of Gentian, Cinamon, Centaury.

Averyhow extolls Bezaur stone above all, the Dofe is the fourth part of an aureus.

Arifiales mea bayuacod deuadurn, describes a kind of Locutaft that is an Antidote against the Scorpion, which eaten presently cures the flingsings of Scorpions.

Serapis affirms the root of the male Coloquintida bruised and laid to the wound, that it will take away the pain. He commends inwardly Wormwood, Lettice-feed with Garlick, Mummy two grains, with the decoction of Sapamire, and leaves of Laiercwor.
Orithagium approves of the Lily roots, and leaves, bruised and applied, as also a Plaifer of Vervain, and it is thus made. Take Vervain three ounces, Roifin six ounces, Wax, Pitch, of each two ounces and half; Oyl half an ounce, make a Plaifer.

Inwardly he commends the athes of River-crabs with Goats milk, or juice of Agrimony two ounces, with a draught of Wine, or the root of Dragons bruised, with wine.

Asius commends water Calamints and Nip, which some think to be so called because it is an Antidote against *Nepas*, that is Scorpions. He faith, Garden-snails bruised and laid on drawers forth the venom; he commends also upright and green Vervain, if it be laid on for a Carapace. Alfo Sheeps dung laid on with Wine. He makes alfo this Plaifer. Take Wilde Rues bruised with Vinegar one dram, Wax one dram, Pine Roifin three ounces, make a Plaifer; it is admirable against the stings of Scorpions.

Inwardly, he writes that Garden Partnips cure beyond expectation, be it eaten green or dried, and drank with Wine. Take Caltoreum, Lazeron, Pepper, of each four drams, bitter Cofthus, Spikenard, Saffron, juice of Centuary the leafe, of each two drams, clarified Honey what may suffice, mingle them. The Dole is the quantity of a Hazel-nut with Wine and water; it drives the Scorpions venome from any part, as Asius proved on himself. *Agina* gives quick Brimstone bruised with a River-crab to drink in Wine.

None bids lay on Licharge or Silver presently upon the place stung, and he commends Brimstones, if it be taken the quantity of an *Egyptian* bean with eight grains of Pepper in Wine.

Anatolius commends this, to sprinkle Crows dung upon the stinging of the Scorpion.

Silvaticui out of *Half* commends a Want, or the greater house Loufe laid on, and out of Scarpin Pewter powdered and drank.

Orphes commends Coral in drink, and the stone called Scorpiones laid on with a Garlik-head, Oilavis, Arctes, Horatius, Zoraphres, Florentius, Apulius, Demonstis, and other Authors of the Geoponica, add but a few things to the Medicaments of the Ancients, besides some old wives fables, and inched prints that are hatefull to God and man. *Pliny* tells fuch a fiction, but no man can tell with what reafon or credit: *If faith* he, one that is stung with a Scorpion get uppon an Afe, with his face toward his tail, he shall do well, but the Afe will suffe.

Myrespin extolls the herb Flower-de-luce, well bruished, and then drank with Wine or Vinegar.

Quintus Serwus writes thus, and advieth,

_These are small things, but yet their wounds are_  
_And in pure bodies lurking do most harm, (great)_  
_For when our senses inward do retreat,_  
_And men are fast asleep, they need some charm,_  
_The Spider and the cruel Scorpion._  
_Are wont to sting, witness great Orions._

_Slaye by a Scorpion, for poysons small_  
_Have mighty forces, and therefore presently_  
_Lay on a Scorpion bruished, to recall_  
_The venome, or Sea-water to apply._  
_It is held full good, such vertue is in brine,_  
_And 'tis appro'de to drink your fill of Wine._

*Pliny* amongst outward means addeth thefe: Mustard-feed bruished, Pippemels, roots of Chameleon, Sea-weeds, wilde Onions, Hares renne, *Torrtoyse-gall*, athes of Hens dung, Colts-foot, and Mullen-leaves: It is exceeding good to purge the body within, very well, with the seed of wilde Cucumber, and *Elaterium*, and then to drink the juice of Lettice, and to drink the dried leaves and flarks in Vinegar.

Ammi drank with Lime-fod.  
Wildle Cumin.  
The third kind of Canila.  
Fennel-feed.  
Root of Cyprus.  
Great Saffron.  
Gelies.  
Yellow Camomil.  
The tender flarks of green Figs.  
Bay-berricys.  

The seed of Hyacinth with Southern-wod.
Seeds of Triority; and Rocker.
Four oboli of Agrick.
The juice of Jelly-flowers and Plantain.
The Athes of River Frogs.
Chamapiythe.
The herb *Nudia*.
Seed of white Thorn.
Flame-coloured Campions.

Arnoldus Villanovus hath thefe: Herb *Trinity* cures the wounds of Scorpions, and kills the Scorpions themselves. Let the sick drink one spoonfull of the juice of the root of Dwarf-elder with Wine, and it is an infallible remedy. Take of the roots of Cappars, Coloquintis, Worm-wod, long Arifolochia, Gentian, Bay-berrics, Yellow Ryn. White Briony, of each alike, make it up with Honey, *The Dole* is the quantity of a Nurt with Wine. *Another*. Take feeds of wilde Rue, Cumin, Garlick, Hazel-nuts, of each one dram leaves of dried Rue one grain and half, Myrrhe, Frankincens, each one grain, white Pepper, Opium, each three drams, Opoponas, Galbanum, of each half a dram, make it up with Honey. The Dole is the quantity of a Bean with Wine. *John Arden an English man* (he was in his time the most skilfull Chirurgeon in England) after his long practive in England and France, he affirms he could finde nothing more fast against the stings of the Scorpions, then to draw forth two or three drops of blood hard by

X x x x the
the wound, and presently to anoint the wound with the same blood. Cellus faith that those Physi- cians did some fuch thing, who were wont to keep the blood they drew forth of the arms of those that were flung. And this fhall suffice for remedies againft the stingings of Scorpions.

It any man chance to be bit by Rhabit Scorpion (which we called Bunch't-back) the first day a fmall pain is perceived, but the second, ftrangeness, heavines, and f Kındnes is zeal'd on the tick; the colour of the body is divers almost every hour, and changing from green, yellow, white, and red; whence it may appear, that all the humours are infect'd, the place burns by the confluence of pain, and humour, fwounding fowles, and trembling of the heart, an acue Fever, and fwelling of the tongue, by reafon of humour mel'd and corrupting, in the brain, and falling down on the roots and muscles of the tongue: sometimes alfo the mine is blow'd, by reafon of the armony of the venonous matter; and green choier is call forth by vomit, alfo the guts are torment'd with a fharl and vehement pain. Almost all fymptoms fall upon the nerves that can happen to them. Rhabit bids cure all fuch things this way: First, incisor being made on the place, and cupping glaffes, apply them with a ftrong actual cauter, then anoint the wound with the juice of wide Endive, or with oyl of Rofes, Bartley wine of a piece of Milk, and with all cold things. If the belly be not fpofible, make it fo with a gentle Clyfter, and the juice of Bilres, Nitre, and oyl of Violers, and let the patient take thus. Tharick. Take Opoponax, Myrthe, Galbanum, Catoferum, white Pepper, of each alike, make it up with liquid Storax and Honey. The Dofe is the quantity of a Jujube: the part must be funed with a piece of a milflone' heart, and sprinkled with Vinegar. Alfo foment it with water of wide Lertice. The uftal Tharick. Take the rind of the root of Capparis, root of Coloquintida, Wormwood, round Birthworths, Hepatica, wide Dandelin, dried, each alike: make a Powder: the Dofe is two drams; alfo fowle Apples must be eaten. For pain in the belly: Let him drink a piece of Rofes, with Bartley water, Critals, Gords, alfo give foure Milk. For trembling of the heart: Let him take juice of Endive, or fyrup of Vinegar, or fyrup of Apples, with troches of Camphire, or fowre Milk the fame way. If the wound be affift'd with great pain: Lay on a Coverall of Bole and Vinegar: for a defentative and for a sharp remedy, lay on Euforthbium, or Catoferum, Poly root drank with water, and a Rans flesh buns, is profitable. Therick, call'd Hafcarins fows in- vented in the Province of Hafcarum. Take leaves of red Rofes iv. drams, Spodium iv. drams, Citron Sanders iv. drams and half, Saffron iv. dram, Licorice iv. drams, seeds of Critals, Melons, Cucumers, Gords, Gum tragaat, Spike, each i. dram, Lignum Aloes, Cardamon, Amylum, Camphir, each i. dram, molt white Sugar, Mams, each i. dram, with the mucilage of Fleatworl and Rofe-water, what may fuffice, make it up. The people of Hafcarum was wont to draw blood from the tick (fairly holy Abbas) almoft till they faint'd: then they gave fweet milk to drink, and water dil- til'd from fowre Apples, Alfo they gave fowre Milk in great quantity. Thus the Arabians speak of this petifent kinde of Scorpions that Nicander and all the Greeks were ignorant of, and that was too common in the Courtrey of Hafcarum. Now we will speeke of Spiders.

CHAP. XI.

Of the Name of Spiders, and their Differences.

The Name.
The Latine name Araneus, or Arané is in Greek, Ἀράνε, from the flender feet it hath, or from its high gate, fome the cobwebes it spins: Others call him προπαδός, or Μαφ- κατρίζιον; Kiramide, Σχερός; Hafchima, ανθ; the Hebrews, Ακαβίς, Ακαβία, Σεμα- μίθις; in Arabick, Sıbth and Phibis, Aalbahis, and Aalbani, as it is called by Bélumofini: the Germans call it Spinn, and Banger; the English, Arterop, Spider, Spinner; the Brabant, Spins, and French, Araigne; Italian, Ragnà, Ragnà; the Spanish, Arana; or Tarama; the Scarvanons, Sparwuck; the Polonians, Palack; the Barbarians, Kranan, Krefmatis; Iδρος, κτ. c. 12. faith it is called Araneus, because it is bred and nourished by the air: a twofold error: for if they live by the air, wherefore are they so careful to weave nets, and catch Flies? and if they were bred of the air, wherefore do they copulate? wherefore do they thrust forth little worms and egges? but we will pardon the elegant Erymologer, becaufe who makes a cutome to play thus with words. There are many of their kindes, and all of them have three joynts in their legs:

A little head and body smalls;
With flender feet, and very tall;
Belly great, and from thence come all
The webs it spins.

The different.
Now Spiders are venomous, or harmless; of harmless some are tame or house-spiders, those are the bigget of all; others live in the open air, and from their greedines are called hunters or wolves: the smaller kindes of thefe do not weave; but the greater fort begins his web very sharp and small by the hedges, or upon the ground, having a little hole to creep into, and laying the beginnings of his webs within, observing whilst something makes the web, then he runs to catch
catch it. The venomous Spiders called Phalangia, are so venomous, that the place they wound will presently swell. These are of two kindes; for some are leis, some greater; the leis are various, violent, sharp, falacious, and going as it were rebounding, which as we read, are called *Actae*, or *Plinas* or *Apis*; others are called *Oribates*, which are found especially on trees in mountains; they are called *Hydroporums*, because they live under leaves. *Geminus*. It is a hairy creature; and breeds in the greater trees. The belly of it is moderately with incisions, that the cutting may seem to be marked by thred. *Aelianus*.

**CHAP. XII.**

Of Spiders that are hurtful, or Phalangia.

In Italy they know not the Phalangium (said Pliny) It is of sundry kindes; one is great like a Pumière, but much greater, with a red head; the other part of his body is black, with white spots running between. The Pumière kindes of *Aetius* hath a snaky body, an alë-coloured neck, and the back as it were adorned with spots. *Nicander* his *Actae*; *Actae* calls *Atenus* the Lynx calls it *Venator*; it makes a weak wound and without pain, but yet a little venomous; it is found amongst the Spiders webs, where (like hunters) it catcheth Flies, Bees, Horse-flies, Ox-flies, and Wasps also, and (unless you will not credit Loniceris,) Hornets too, and it spoils all that the nets can take and hold: that this is the fame with *Aries* is *Pulex* no reasonable man will deny. It hath a broad round volubulous body, the parts about the neck have an incision; and there are bred three eminences about the mouth. There is another Phalangium which *Nicander* calls *Pulicis*, *Actae* *Pulicis*; *Aelian* *Pulicis* (from the likeness of it to the stone of a black Grape) itis round, and black, and shining, and globe-like, the feet are extreme short, as if they were imperfect, but it moves swiftly; it hath a mouth but with teeth bred under the belly, and it moves with all the feet at once. Whether *Aries* Spider will bite, let the Reader judge. Truly it is not much unlike it, as Grevinus rightly conjectured. In this description, *Actae*, *Aelianus*, *Pulicis* do almost agree with *Nicander*. *Aelian* put long feet amids for small feet, and affirmed it to be only an African creature. *Actae*, were the same, unless it were distinguished by certain whitestars and lines, that are fat and transparent. Only Pliny after *Nicander* made mention of this, as if it had been unknown to *Aries*, *Galen*, *Aelian*, *Ebianus*. The bled with coloured Spider is worse than all these, called by *Nicander* *Pulicis*; going on both sides with very long and tall feet; the Scholaft adds *Pulicis*, that is downy and high, not high downy, as Lonicerus transcribes it. Pliny faith hairy with black down, though I can hardly be induced to believe that the bled with Phalangium is hairy with black down. *Nicander* calls that Phalangium *Pulicis*, which others call *Pomax*, differing only from the red Hornet by want of wings, and is wonderful red. It is held far worse than the blew, though that by only touching doth communicate her venom, and break a crystal looking-glass (faith Scaliger) by running over it. There are two kindes of *Tetragnathia*, the world is with a white line running along the middle of the head, and another across that. The milder or alë-coloured, white on the latter parts is of the same colour, and that makes very broad nets for flies on the walls. Pliny, and Hermolaus. But as *Aetius* faith, *Tetragnathia* is one kind of Phalangium, with a broad body, whittifh, with rough feet, it hath two little wings in the head, one uprightness, the other broad, that it seems to have two mouths, and four cheeks. *Aelian* faith there is a great number of them about the River Arbas in *Indias* sometimes deadly to the Inhabitants. In harvest time they are found amongst pulse, (when they are gathered with the hands) some small Phalangia are like to Beetles.
ties, of a flame-red colour; such are those the English call *Tarrantula*, by eating whereof cattle are oft-times killed: Phalangium breeds amongst reeds, and in the Peach-tree they call it *phalangiarius*, by *Niceander*; *Acicinum*, *kachykarios*, by Diophortes, because it boldly strikes the heads of those that pass by it, when it descends by a thread, or falls down without it. It is a little creature in the shape of a Butterfly Philaena; it goes hurriedly with the head always nodding, and a heavy belly; it is of a long body and a greenish colour; it hath its fting in the top of its necks if it light upon any man, it will especially wounds the parts about the head, as *Acicinos* witnesseth; it is nourished in the Peach-tree leaves, and hath wings like to some Butterflies: whence the Scholiast would intitulate that this kind of Phalangium is winged, which no man hath observed yet. *Penecetus* and *Aradogus*, deceived by Rabbi *Mofei* suppothe it to be *Crawuckles*, and the Tarrantula; *Gilbert* an English man followed this errou in the Chapter of the Tarrantula, Scleropeltus, or hard-head, little differs in fashion from the former; it hath a head as hard as a stone, and all the lineaments of its body like those little creatures that fly about candles, Scolion is a long Spider, and varied about the head especially with some spots. There is also a kind of Phalangium, Pliny calls it the Dover Spider, with a very great head; which being cut, they say that two worms are found, which bound to women before conception in a crow's skin, will keep them from conceiving: and this virtue of them will continue for a year, as Cezlius hath left it written in his Commentaries. We call the last *Appulurus*, and commonly Tarrantula, famous by that name, from the Country of Tarantum, where they are most frequent, it borrows its name, we give you here the picture of it, that was belowed upon *Pomnus* by an Italian Merchant of happy memory; where if you paint the white places with a light brown, and the black with a dark brown, you shall the true spotted Tarrantula; I know no man yet that describ'd it as it should be. *Nesebus* *Penecetus* doth sign it to be only with fixe, and *Aradogus* thinks the same, and faith more, that it hath a long tail. *Rhages* calls it Tarrantula, Sypsa, Albus, Aslari; Rabbi *Mofei*, *Aggymorga*, *Aiccinana*, *Scbinis*, Gilbert an English man, Tarrata; for he followed *Aradogus*, who made two kinds of Tarrantula's, one brownish as we have pictured, another Saffron coloured and clear, such as Egyp produceth.

Phalangium is not known in Italy, as we laid out of *Pliny*, but now they are all almost found in the South Country, with great inconvenience to mowers, and hunters, as is manifest by chily experience, *Penecetus* was wonderfully deceived, who in l, c, 15, of the Scorpion, calls Phalangium a venomous Fly. It is a cruel creature (fait Alexandre ab Alexandre) pestilent to touch. In summer when the sun is very hot, their stings are venomous, at other times not. In the coldest Countries there are many Spiders, but no Spiders called Phalangia, or if there be any, they are free from all venom and infection. Tarrantula lie hid in the clumps of furrowes that are cleat with heat, and they strike and wound with their teeth mowers or hunters that are not aware of them; wherefore the inhabitans defend their hands and feet, when they go to mow, or to hawk or hunt, she makes her web like a net very silently, and all the little creatures she can catch, she provides for her fpper. All the Phalangia bring forth in their nest, (that they make thick) and they do as it were sit upon eggs in a great number, and when the young grows up it embraceth the dam and kills her, and oft times calls out the fire, if it can lay hold of him, for he helps the dam to fit, and they bring forth 300. *Bellenius* *fig. 2.* e, 68. observed little Phalangia in sandy grounds creeping up the Hoftes legs, (may be that is it the Germans call *Scein spinos*) by whose contitus bitings they suddenly faint, and flagtering continualliy they confined. Baglini faith that there are ten kinds of Phalangia, but he describes them not. Adixima (I know not out of what Book of Galen) divides the Spiders Phalangia into the Egyptian, the black, the bright red, that men call *Raches* the white, Citron coloured, Grape coloured, Piume-like, like Camans, Wafpy, and mountaintions. But both he and all the Arabians describe them so foolishly (to lay no more) that there can be nothing more confused in so great a matter. Lastly, to add all the kinds of Phalangia which we have seen or read of. I shall annex the *Cretian Phalangians*, you have here the picture of it exactly painted. It is of colour brown and ash-coloured, a smooth body, and hairy legs: near the mouth it is fanged as it were with two hooked prickles, with which it bites and wounds. It lives as the Spiders do by Flies & Butterflies, & makes nets to catch them; the Isles eggs, and froths them under her breast, whence the young ones are thrust forth, which stick under the dam's belly, till growing older they kill her. They dig a hole fit for the bignefs of their body; for as they are not every where of one colour, so they are not of the fame magnitude. They dwell in a case two foot deep, and on the outside they cover it with straw that the drift get not in. All these venomous Spiders are naturally so, for they suck not their poiyon from herbs, (as some think from their
Of lesser living Creatures.

Grievous symptoms follow the bitings of Pitfire Phalangium, for there follows a mighty sign of the swelling on the part bitten, the knees grow weak, the heart trembles, the forces fail, and other symptoms of times death succeeds. Nicander faith that the sick sleep so deeply, that they are alwayes asleep Phalangium, at last, and are in the same condition as those are that are slung by the Viper: Histories relate that Cleopatra set one to her bed, that the might escape Angelus, without pain, nor is the wound deadly unless it be wholly neglected. Rhagias makes a very small wound, and that cannot be seen, after it hath bitten: the lower parts of the eyes, as also of the cheeks waxed, then horror and fainting seize on the loins, and weakness on the knees, the whole body is very cold & hath no heat, and the persons suffer commotion from the malady of the venom. The parts serving for generation is to debilitated, that they can hardly retain their seeds, they make water like to Spiders webs, and they feel pain as tho’ are dung with a spider. From the time of Phallagium, they seem wholly without strength, their knees fail them, quivering and flock invade the patient. The blew Spider is worth of all, causing darkness and vomitious like Spiders webs, then fainting, weakness of the knees Conus, and death. Dyslepis or Wasp-like Phalangium, causeth the same symptoms with the blew, but milder, and with a slow venom brings on purgation. Where the Tetragnathus bite, the place is whitish, and there is a vehement and continual pain in it, the part it self growes small as far as the joyntes, lastingly, the whole body sinketh no profit by its nourishment; and after health recovered, men are troubled with infinitesimal watchings. Austin. Nicander denies directly that the all-coloured Tetragnathus can payson one by biting him. The Cantharides like, or pulse Phalangium saith wheels, which the Greeks call ὓδαθων, the mine is troubled, the eyes are wept adie, the tongue hammer and falls, speaking things improperly, the heart is as it were moved with fiery, and flies up and down. The Vetch kind produces the same mischiefs, and cause Horaces that devoure them, and cast to be very thirsty, and to burst in the middle. Cramocalaptus faith Pliny: if it bite any one, death follows shortly after.

But Austin and Nicander affirm the contrary, and that the wound thereof is cured without any trouble almost at all. Head-sac, cold vertigo, reftlessness, tollings, and prickings pains of the belly follow, but they are all vagued (faith Nicander) by fit remedies. Nettlebeards is like to this in form, and forces and effects the same things, as also the Selicium. We said that the down Phalangium drives away barrenness, if it be carried about ones but whether it be violently venemous, I know no man that hath determined it. The spotted or Phalangium of Apulia, doth produce divers and contrary symptoms according to the complexion of him that is wounded, and his present disposition. For some laugh, some cry, some speak falltering, others are wholly silent, this man sleepes, the other runs up and down always waking; this man rejoicest, is merry and moves up and down, that is sad, loathful, dull; some think themselves to be Kings, and command all; some are mad, and think they are in captivity, and fettered; lastly, as men drunk are not of one quality: so are these that are mad, some are fearful, silent, trembling: some are bold, clamorous, comatant. This is common to them all, to delight in musical instruments, and to apply their minds and bodies to dancing and leaping at the instond of them. Lastly, when by continuance of the disease and the vehemency of it, they feem next unto death, yet when they hear musick they collect their spirits, and they dance with greater cheerfulnes every day. These dancings being continued night and day, at length the spirits being agitated, and the venom driven forth by incontinent transpiration they grow well. But if the Mucians upon any cause do but leave off playing, before the fuel of this mischief be spent, the sick fall into the same disease that they were first oppressed with. We must admire this mol; above other things that all those that are slung with the Tarantulas dance so well, as if they were taught to dance, and sing as well as if they were musically bred. (In Italy it was first invented, and some hath taken it up to call such as are bitten, Tarantuli, or Tarantulus.) Cardanes against faith and experience, denieth that musick can restore any that are bitten, yet we heard the same thing fell out at Bafel, from Felix, Plutus, Theodorus, Eugenius, our most famous, and dear Masters; and we read the same in Mathios, Bellus, pseud. and Paracelsus. And if the sweet musick of pipes could help mad horses, and pains of the hips (as Aesopliades writes) why may it not help those are slung with a Tarantula? Some there are that affign to this diseases, some I know not what small deity, as superintendent over it: they call him St. Vitus who had formerly great skill in singing, he being called upon and pacified with musick, as he is the patron of musick cures them, so that men superstitiously implore that to him, which they should do to musick and dancing. Bellus reports that the Cretian Phalangium induceth the like mischiefs, and the pain and wound oft is also cured by musick. It is no wonder the Ancients described not these two kinds of Phalangium; because they knew them not, nor did they know how to cure their flingings. Dioscorides writes thus of the common bitings of the Phalangia. The symptoms that follow their bitings are commonly these: The place flung looketh red, but neither swell, nor waxeth hot, but it is something royst; when it growes cold the whole body quakes, the hands and groins are stretched out, there is a colick in the loins, they are often urged to make water, and they sweat with very great pain, and labour to go to the floor, and cold sweats runs down every where, and tears trickle down from their
darkened eyes. *Anisum* adds further: They are kept waking, they have frequent emotion of the yard, their head pricks, sometimes their eyes and their leg-grow hollow. Their belly is unequally lachexed out with winds; and their whole body sweats, chiefly their face, their gums, their tongues, and onils: they bring forth their words foolishly and gaping, sometimes they are trou-
bled with difficulty to make water; they are pinned in their secret, they make urine like water and full of cobwebs. The part affected is prickled and sweats, (which *Disorides* denied before) and it is moderately red. So saith *Anisum* from whom *Paulus, Mithanvaris, Argoppos, differ but little. *Gal. 3, de loc. eff. c. 7.* hath it thus. The birings faith he of the Phalangia are scarce to be seen: it fitt affects only the skin, and from the superficialies of it, it is carried by the com-
munity of the fibers to the brain, and into the whole body: for the skin comes from the mem-
branes and they from the nerves and the brain; this is clear, because by presently binding it on the other parts, they are preferred from the venom that is near to them. In *Achatinu* they that are bit by the Phalangia are otherwise affected, and more grievously, in other parts: their body is astonifh'd, weakened, trembles, and is very cold: vomiting and convolvulion follows, and inflamation of the yard: their ears are afflicted with molt cruel pain, and the foles of their feet. They use bathing for a remedy; if the party recovered go willingly into bathes afterwards, or were by chance or by craft brought into them, by the hot water the contagion pafliter on the whole body, and he perceives the fame mitchief in the whole body. *Disorides* writes the fame things in the chapter concerning Trifoly that fends as Alphaltum. The decoction of the whole plant effeth all the pain byfomentation, where Serpents have flung men, what manfe-
ver that hath ulcers and walhet himself in the fame bath, is so affected, as he that was bit by a Serpent; *Galen* faith he thinks it is done by a miracle. *Lib. de Theria et Pifonem.* *Galen* did write that Book. But *Elias* speaks more miraculously, where he affirms that they may happen to those that are found, making no mention of ulcers. And thus much for symphomes. *Now for the cure.*

The cure is particular or general. Physicians speak of but a few particular cures, because the general is commonly effectual.

But *Plini* sets down a remedy against the biting of the Phalangium called *Formicarium;* that hath a red head: to flew another of the fame kind to him that is wounded, and they are kept dead for this purpose. Also a young Wealit is very good, whose belly is fluit with Conander, kept long and drank in Wine, A Wap, that is called *Ichenomen* bruited and applied drives back the venom of the *Phalangiumfoliariun* (faith *Bellona*) not otherwise than as one living kills another, that is alive. For *Ichenomen* (faith *Arifatex,* is a small creature that is an en-
emy to the Phalangia; it often goes into their holes, and goes forth again, lodging its labour. For it is a matter of great labour for so small a creature to draw forth its enemy greater than it self by force; but if he light upon his enemy preying abroad, he drags the Phalangium as easily with him as a Pumice doth a corn; and the more fully he draws himsclf back, the Wap draws him on the more fiercely, and sparing no pains, doth beat himself with all his might; sometimes when he is tired with too much labour, he flies away and breathes himself; and having recoved-
red breath, he goes to seek for the Phalangium again, and thinking him often with his wings, at last he kills him; when he hath killed him, he carries him into his own habitacion on high, and there it renewes its kind by fatting upon them. Those whom the Tarantula strikes, are helped by violent and constant motion, but *Celio* on the other side commands those that are bitting by the other kinds of Phalangia, to be quiet and to move but little. But mufic and finging are the tue Antidote of it. *Christophorus de beneuio* bids presently exhibit *Theria et Andromachi,* Also he gives Butter and Honey, and Saltiron root with Wine.* The Bezar of it are the green grains of the Maftere tree. *Pomatus lib. de venen.* periwades to give ten grains of Maftere with Milk, or juice of the leaves of Mulberries, j ounce and half. In the augmentation he cureth it with Agarick of white Brions, after sweating much they must be refreathed with cold and moist things, as with Poppy-water. *Merula* faith they are cured with finging, dancing, leaping, and colours; I will not contend for the first three; but I cannot see how they can be cured with co-
lores especially when as they that are flung are blinde, or see very little. He faith also that in-
habitants and citizens are hurt by them, but strangers are safe and out of danger, which no man of a small belief, or not very great faith can believe. *Disorides* appoints a general cure: Firth, fcarifying must be repeated, and cupping glaffes fet on with a great fire. *Afbrum* coun-
sels to fume the part flricken, with the thiels of Hens eggs flift steeped in Vinegars, and burned with Harts-horn, or Galbanum.

Then you must use fcarification, and draw forth the blood by finking or cupping glaffes, Or, which is safest:burn the place affected with an actual Cuautry, unless it were full of nerves; for then it is best to fet a Cauntry on the neighbouring parts. Then sweat must be provoked with clothes laid on or rather by gentle and long walking. Lastly, to perfect the cure, you must prove by external and internal Medicines, such as we here fet down, and the most commodious and most noted we mark with an Afterick. Internal remedies out of *Disorides*: Take seeds of Southerwood, Anniseed, Cummin feed, Dill, round Birthwos, wildle Cices, Cedar fruit, Plantain, Trifoly, seed of Minimiches, each alike, bruise them severally; the Dole of them severally is 1 drams in Wine, but if you joyn many of them together, drink ii drams or iv with Wine; also 1 dram of the fruit of Tamarisk is effectual, with Wine, Chamepifh, and the decoction.
decoction of green Cyprus nuts with Wine.* Some prove of the juice of River-crabs with Alse milk and Smallage-feed, and they promise it shall presently take away all pains. Also a Ly of the Fig-tree is drank against the bitings of the Phalangia; also it is good to drink the fruit of the Turpentine tree, Bay-berries, Balm-leaves, the seeds of all the wide Carrots, and of Coriander, the juice of Myrtle-berries, Ivy, Mulberry, Cabbage and Clover-leaves, with Wine or Vinegar, one dram of the leaves of Bean Trioly drank with Wine.

Decoction of Spinagrus root, juice of Houfeleek, juice of Clovers with Wine. He also commands a snail bruised raw, and drank with Alse milk. * Alse Balm-leaves with Nitre; and Mallowes boiled with the roots, drank often. The leaves, flowers, and seeds of the herb Phalangia, and the seed of Gith, the Decoction of Alsparagus, Mock Cervell, and the juice of Mullberries.

Out of Gaul.

Take Birthwort, Opium, of each four aures, roots of Pellitory of Spain three aures, make Trochis as big as a Bean; the Dole is two Trochis with three ounces of pure Wine. The ashes of a Rams hoof drank with Wine and Honey. The remedies of Diophanis, against the bitings of the Phalangia. Take Birthwort four drams, Pellitory as much, Pepper two drams, Opium one dram, make little Cakes as big as Beans, take two, with two Cycathi of the beet Wine.

Another that is better. Take seeds of wilde Rue, Rocker-feed, Pellitory, Storax, quick Brinton, each six drams, Calleyrum two drams, mingle them, make Trochis as before with Snails blood; the Dole is three oboli in Wine, Another. Take Myrrhe, Calforum, Storax, each one dram, Opium two drams, Galbanum three drams, Annifeed, and Smallage of each one aceta- blum. Pepper thirty grains, make it up with Wine. Another. Take Myrrhe five drams, Spike of Syria six drams, flowers of the round Cane two drams and half, Caffa four drams, Cinnamon three drams, while Pepper one dram and half, Frankincense one dram and one obulus, Collins one dram, make it up with Athenian Honey; the Dole is the quantity of a Hazel-nut with water, or with Honey and water. Apollocon* remedies. Take wilde Cumin one aceta-blum, blood of a Sea-cottace four drams, rumen of a Hinde or Hare three drams, Kids blood four drams, make them up with the beet Wine, and lay them up; the Dole is the quantity of an Olive, in half a Cyathus of Wine. Another. Take seed of bituminous Trifoly, round Birthwort, seeds of wilde Rue, Tare-feed dried in the Sun, each six drams, drink them in Wine, and make Cakes, four drams weight; the Dole is one Cake, Gal. 2. de Antid, where he hath collected many remedies from Authors.

Out of Aetius and Asinia.

Take quick Brinton, Galbanum, each four drams, bitter Almonds blanche, juice of Leaf- wort two drams, of Alla four drams, mingle them with Wine and Honey, and drink them, also lay them on thus. Another. Take Ameos two drams, Flower-de-luce one dram, or of St John's-wort, or bituminous Trifoly, drink them in Wine, or take Annifeed, wilde Carrot-feed, Cumin-feed, Gith, Pepper, Agarick, each one dram, drink it. Or take leaves of Cyprus-tree, or the Nuts bruited in Wine and Oyl one Hemina, and drink it.

For this he prescribes Bay-berries, the herb Scorpions gralle, Serpents, Liferwort, Calaminth, Camphrtha, by themselves, or with Rue and Pepper. Another. A bunch of Mints boiled in freth Poica, let the sick drink two Cycathi: Also Germundare, Camphrapyth, white Thorn, and Penotyall in decoction are good. Also a Ly and juice of Ivy with Vinagre. Alfe epliated ued thef. Take feed of Sphondylium dried, Calamine, each alike, bruise them, and drink often in a day two-Cycathi of Wine with them. Another. Take juice of Lifefont, Daur- cus-feed, dried Mints, Spikenard, each alike, make it up with Vinagre; the Dole is one dram: take it with Poica and Wine, four Cycathi, and presently go into a hot Bath; when Liferwort is wanting, take the double portion of pure Affa.

One that is better. Take of Cenchryis, seeds of wilde Rue, Pepper, Myrrhe, wilde Vine, of each one dram and half, Cyprus root one dram, make a Confection; the Dole is one dram, with four Cycathi of Wine, and one Cyathy of Honey. Also the eating of Garlick is good, as also a Bath and Wine, and such things as help against Wipers stings, Paulus repeats the same remedies, and Theben Cumin, or feed of Agnus Caflus or leaves of the white Poplar-tree drank in Beer are very effectual.

Out of Nicther. Root of the Turpentine tree, Pine or Pitch-tree, drank or swallowed, is exceeding good, which Gefam and Bellonius say they learned by experience, to be true.

Out of Avicina. The Myrtle-tree and the fruit of it, Doronicum, Matilic, Alfifatioid, Dodder and its root, the Indian Hazel-nut (which is Theriac for this disease) white Bedellium, all of these drank with Wine. Take roots of Birthwort, Flower-de-luce, Spike Celtis, Pellitory of Spain, Dacus, black Hellebore, Cumin, root of Daffodil, leaves of Winter Wheat, leaves of Dough-tooth, Pomegranate tops, Hares Renner, Cinamon, juice of River-cubs, Storax, Opium, Carbophil/amion, of each one ounce, beat all to powder, and make Trochis, the weight of ounce; all these are the Dose of them. Also give in Wine the decoction of the leaves of bitumen Trifoly, of the Cyprus Nut, Smallage-feed. Moreover give to drink, Pine kernels, Ethiopian Cumin, leaves and rinde of the Plane-tree, seeds of Siler Montannum, black wilde Chitches, seed of Nigelles, Southern-wood, Dillon, Birthwort, fruit of the Tamarisk, for all these are very good. Also the juice of wilde Lettice and Houteleek are commended.
The decotion of Cyprian Nuts, especially with Cinnamon and River-crabs, juice and juice of a Goose: Also the decotion of Spirengus with Wine and water.

Another. Take Birthwort, Cumin, each three drams with hot water: An approved Tonic.

Take Nigella, seed ten drams, Daucus, Cumin, each five drams, Cyprian roots and Nuts, each three drams, Spikenard, Bay-berreries, round Birthwort, Carphallamum, Cinnamon, Gentian, feeds of Siler Montanum, and of Smallage, each two drams, make a Confection with Honey; the Dose is the quantity of a Nut with old Wine. Confection of Afa. Take Afa fucidae Myrrhe, Rue-leaves, each slike, make it up with Honey; the Dose is one or two drams with Wine.

Out of Abysters, Lullus, Albucases, Rhafos, Pulzettaus. Take white Pepper thirty grains, with a draught of old Wine, take it often. Also Thyme is given in Wine. Abysters. Drink upon it one spoonful of Wine diluted with Balm. Lullus. Take dry Rue, Celius, wilde Mints, Petalloty of Spain, Cardaman, each slike, Afa fucida one fourth part, Honey what may suffice, mingle all, and make it up; the Dose is the weight of an Hazel-nut in drinke. Abucasia. A Hens brain drank with a little Pepper in sweet Wine or Pofta. The decotion of Cyprian-nuts with Wine. A Thrias against the bitings of Phallangia. Take Tatar six drams, yellow Bristomites eight drams, Rue-feed three drams, Calelaenum, Rocket-feed each two drams, with the blood of the Sea-tortoise, make an Opiate; the dose is one dram with Wine. Another. Take Petalloty of Spain, round Birthwort, each one part, white Pepper half a part, Hocehoud four parts, make it up with Honey; the Dose is one dram. Another. Roots of Cipers, long Birthwort, Bay-berreries, Gentian root, each slike, drink it with Wine, O: drink Distilla with strong Wine, and Cumin, and Agnus Catus feed. Another. Take Nigella feed ten drams, Daucus, Cumin, each five drams, wilde Rue-feed, Cyprian Nuts, each three drams, Indica Spike, Bay-berreries, round Birthwort, Carphallamum, Cinnamon, Gentian root, feed of bituminous Trifoly, Smallage-feed, each two drams, make a Confection with Honey; the Dose is the quantity of a Nut with old Wine. Rhafo.

Out of Pliny, Celius, Scaliger.

It is good for those that are bitten by the Phallangia to drink five Frinices, or one dram of the Roman Nigella feed, or black berries with hypocotylis and Honey. Alfo Marith Smallage and wilde Rue, are peculiar against the bitings of the Phallangia: Also the blood of the Land Tortoise is good, juice of Originum, the root of Polymonts, Vevain, Cinquefoil, the seed of Garden Onysons, all the kindes of Houtritic, roots of Cyprus, Turnille with three grains of juice of Ivy-roots in Wine or Pofta; alfo Calloreme two drams, in Maltum to caufe vomit, or in juice of Rue to make it dry. Alfo Agnus Catus feed two drams: Apoldonan that followed Democraat calls a kind of herb: Crocodie by the touch thereof Phallagia dies, and their force is abated; the Marc-ins leaves next the root, eaten do profit. Pliny. Take wilde Vine-berreries, Myrrhe, each slike, drink them out of one Hemina of hot Wine. Alfo the feed of Radish, or root of Damar must be drank with Wine, * Celius. But amongst many other remedies that are proved, one Antidote is due to Scaliger, who was the ornament of our world and age; the form of it is this. Take true round Birthwort, Mithridate, each two ounces, Terra Sigillata half an ounce. Fies living in the flowers of Nepelus, 22, Citron juice what may serve turn, mingle them, For faith he, against this venome or any other bitings of Serpentis, Art hath scarce yet found out so effectual a remedy. Scaliger. Juice of Apples drank, or of Endive, are the Bezar against the bitings of the Phallangia: Petrus de Albano. These are the most approved outward remedies. Five Spiders purefied in Oyl and laid on, Alles or Horfe dung anoynted on with Oyl or Pofta: Take Vinegar three sextars, Brimifone a fith part, mingle them, foment the place with a sponge or a bath, the pain being a little abated, wah the place with much sea-water: fome think that the flone Agates will cure all bitings of the Phallangia, and for that reason it is brought out of India and fold dear. Pliny. Fig-tree sifes with Salt and Wine, the root of the wilde Papame bruited, Birthwort and Barley-meal impalid with Vinegar, water and Honey and Salt for a fomentation. Deccion of Balm, or the leaves of it made into a Pultis and applied; we mutt constantly use hot Baths, Pliny. Open the veins of the tongue, and rub the places white with much Salt and Vinegar, then p.woke fievat diligentely and warmly. Figetius. The practical men mightly commend the root of Panax Chironia, Theophrastus. Anoynt the wound with Oyl, Garlick bruited, or Onyons, or Korn-graffe, or Barley-meal with Bay-leaves, and Wine, or Wine Lees, or wilde Rue,lay it on with Vinegar for a Cataplaume. Nonius. Take live Brimifone, Galbamus, each four Denarii, Lybian juice and Euphorbiam, each slike, Hazel-nuts plied, each two drams, dilolve them in Wine, and with wine make a Cataplaume, alfo inwardly it helps much. Flies bruied and laid on the part affected. Alfo a Barbel heals the bites of a venemous Spider, if it be cut raw and applied to it. Galen. Anoynt all the body with a moft liquld Oyntment with wax. Foment the part affected with Oyl, wherein bituminous Trifoly hath been foked, or with a Sponge and hot Vinegar, very often. Make alfo a Cataplaume of thefe that followeth, namely, with Onyons, Bloodwood, Solomons seal, Leeks, Brin boyled in Vinegar, Barley-meal, and Bay-leaves, boyled in Honey and Wine. Make them alfo with Rye, Goats dung with Wine, Cyprus, Maronam, and wilde Rue with Vinegar. Aftermin his Plaifer, Take feed of wilde Rue, Rocket-feeds Staves-are, of Cenchus, Agnus Catus, of Apples, Nuts, of Leves of Cyprus, each slike, brathe all with Vinegar, and with Honey make a Plaifer. Asin. Lay the decotion of Luiripes upon the place affected, the Echta being first taken away, then anoyn
Chap. 13.

Of lesser living Creatures.

Now let us see

That Spider with which our minde well agree,
Who sat within the midle of a net to watch
Where the East winds blow, it shakes, he doth catch
Flies that but touch his web, none can him match.

Chap. XIII.

Of the tame or boose Spider.

A mongst Insects, though many may be found (as Pliny, Calvis, Curio the second out of whom we have fetched many of these things, lay right) that may exercise great wits, yet the nature of Spiders is worthy to be admired in chief, and is apparent by their curious workings, as any reasonable man will judge. Aristotle the greatest diver into Nature, faith that this is the most magnificent, and wisest of all Insects. And Solomon himself at whose wit'sonne all the world admired, amongst those four Animals that exceed Philosophers for their knowledge, reckons up the Spider, dwelling as he faith in Kings Palaces, and weaving Webs that man cannot do the like. The Poets fay that the Spider was once a Lyathan Mayd, that Minerva had taught to work with the needle, and weaving all curious artificiall work: but she was grown so proud of this skill, that she denied that ever she learned this of Pallas, and the processe to fave in arrogancy, that she boldly challenged Minerva to work with her in all these Arts: Wherefore Pallas disdaining her pride, came, and sharply rebukiing the Mayd for her insolence, brake all her fine wrought works with a Wand: At this the Mayd was so abashed, and thought to have hanged her self, but the Goddesse pitying the poor Maid's condition, would not suffer her to do so, but as he hang by a very fine Cord, she changed her shape into a Spider.

Pallas was angry, and in wrath she said,
Yet live and hang thou, proud and haughty Mayd,
And that thou mayst still suffer 'tis my mind,
The same law lefts for thee, and for thy kind.

But they that interpreted this a Fable or a Hiftory, say that Arachne found out the art of spinning, towning, and weaving hemp, taking pattern by the Spiders. And this needs not seem strange to any man, since the Swallowes found out the art of plaiting, and for Oculifles, Eagles for building, Hippotamass for letting blood, Isis for giving Glyfters, Goats for Antidotes, so Tortoises, Weasels, Storks have infringed us.

To praise the Spider as I ought, I shall first fer before you the riches of its body, then of its fortune, lastly of its minde. If you consider the matter of its, it is light, containing much of Air and Fire (that are the most active and noblest Elements) but it hath little of earthy dregs and gravity. Consider the figure it is wholly round and orbicular, or at least Ovall, that is next unto it. The substance of it is thin, transparent, subtle, and though sometimes by the abundance of phlegm and phlegm, it becomes so fram'd, that it grows as great as a Walnut, and Cardes are not as great as a Sparrow sometimes, yet if you see it hanging in its Web, against the light, it shines all through like a Chryfoltite, and makes reflexion of beams most grateful to the eye. It hath the same colour that Ovid writes that Loves have, that is, pale; and when it flicks aloft with its feet, it calls every way, the exactly represents a painted Scare. As if Nature had appointed not only to make it round like the Heavens, but with rays like the Sun, as if they were alive. The skin of it is so soft, smooth, polished and near, that the preceeds the foffet skinned Mayd, and the daintièft and most beautifull Scurpm, and it to clear that you may almost fee your face in her as in a Glass; the thinf fingers, that the molt gallant...
The Theater of Insects: or, Book II.

Gallant Virgins desire to have theirs like to them, long slender, round, of exact feeling, that as the Scopendres, nor is she without feet, as some Insects are, nor hath only six feet, as those that want wings have, but eight feet, which number is next to the most perfect number, as all men know. These legs also are made in a sequestrial proportion, which is most admirable and venerable; so that though the latter feet be always shorter than the former, yet they hold still their proportion. Many Philosophers who hold that Spiders are blinde, are blinde themselves, for were they blinde, how should they make choice of those places that are most convenient for to pitch their nests, and who should lead them to slay one thred to another, and should know how to mend their Webs when they are broken by accident? When as also the tame and familiar Spiders will come from a distance to catch a Flie that toucheth but the sides of their threads, they are the more bold to pursue them, and will take them as it were from hand to hand, as we have often seen. Truly they are blinde at noon-day, and understand nothing, so say, that Spiders are blinde. In this Spider there is no poyson nor hurt, for if it bite it is with- out harm, and it is rather tickling then painful. Also their very Carcase, and their bodies, when their eyes, their excrements, are good and usefull for many diseases, as we shall make it plain enough when we speak of their use. I know not what it was that made Personio so frighted when he thought of eating them; for he knew a Noble English Lady, and Phærus a Philosopher, that did often eat them without any hurt at all. For the truth is, Spiders are free from poy- son, and are very good for ones health. But because it seems so horrid a Creature, some people, that the very fight of it makes them fly from it, I rather attribute that to their me- ncholoy apprehension, tenderness and diftemper, than to the ill form of the Spider. Nature hath used no little elegance and beauty in the Spider, then she hath done in the Butterfly, and Flies, and it is no light device of the mundane to daddin to beautiful a work, and to be afraid of a Creature that weaves so curiously. Lastly God hath given a wonderful disposition and nature of the skin to so wonderful a body; for it doeth not only once a year (as Vipes doe) but every Month it the be well fed she changeth her skin, and recovereth a new one that is more curious. Also it is of so excellent a temper, and so fragall in its diet; that in a wholesome place, where the canger any provision, she will live always, I think that to be the chiefest good amongst the goods of Fortune, or rather Fate, that they carry the matter of their Webs in their bell- ly, and they are so well forred with it, that a Spider can draw forth imnumerable threads and weave them, and catch if need be, a hundred Flies, and have Needs enow to wrap them in. And though they have not meat in a Granary as Pititines have, nor ready and growing up Beeshave, but they live only upon food they light upon by chance, yet by Gods providence the prey comes flying by that sustains them, and oft times they grow fat with plentifull dills that they take by holitly. Further, I should think it no small part of good Fortune given to the Spider, that when she is satisfied with the troublesome fare of the Court, yet the never hath the Gout. You have heard that Solomon of old assigned her a place in Kings Palaces, that she might be a pattern to his Courtoys, to labour, to be ingenuous, wise, fragall, and vertuous. There beginning her Webs the work with hands and feet, and never need to goe a hawking for Flies, she feared no affaults, no treachery: and briefly, this most wise creature did but rule in the great Palace of that great King. After him arose bad Princes, that were idle, fol- lowed ill counsellors, that came to name, it is hard to say, how hardly they used the poor Spider, and commanded her to swathe her self with beesome and poles, as if she had beene night-robbors, and to tread her under foote, and to kill her. Presently Furies ran and swept down and spoiled all those learned works that had been wroght, so that she could hardly escape the quick-sighted beelomes of those late devils. She was most miserable now, left al alone in so great abundance, and in so large houses, she could not finde one corner to be it. And by the Kings example, the Nobles and rich men drove out this Mystreffe of labour and verve, and they would not suffer one thred to remain, that was a Token and Engulf of her great widoome. She when once she went abroad to travel (as the Fabulit wittily saith) the Gown by chance came to keep her company, though she could hardly hold pace with her, but with great roil. When as now they had travelled one dayes journey, at night they took counsell to try their Hoft, but they were of different opinions. The Spider going into the City, got into the house of a rich Citizen, and so soon as she began to work and to spread her Tapethry and hangings, (by the example of the bad Kings) he forthwith hates her, and drives her out, and the same night he exposd her to the rain and open air. But the Gown being bane, when he could go no farther, got into the first house of the Town, and could force in- treat to be harboured in the poor-off Cottage there; and when she lay down, the found mercy enough; she had for supper brown bread that her stomach rote against, and a little herbs, scarce any salt upon them, and water was fethed from the next pond in an earthen Pitcher to quench her thirst; being thus entertained, she required a bed to ly on, she could get none but flay or the planks to ly upon, and to the lay down in pitiful misery, lamenting and sighing. But alas how watcht a thing it is for tender limbs, and that cannot endure to be touched (as faith Hippocrates) to ly upon such a hard bed and pillowes. The next morning the Spider and the Gown met again; the Spider complained terribly of the incivility and rudeffe of the rich Citizen, and the Gown on the other side complained of her Hofts poverty and poor fare, showing the
the black and blew marks the hard lodging had made in her skin; and when they had a while taken deliberation about it, they both agreed upon this, that the next night they would change their holts; that the Spider should go to the poor cottages, and the Gown to the Kings palaces and rich men's houses: the Gown not unmindful of this agreement, went to a very rich man's house, and lay down at the feet of a very well fed Master, that was very rich; and so soon as this kindo Holt perceived her, with what humanity, embracings, and cheerfulness did he entertain her! down pillows were laid under her, all the foots and chairs in the chambers are fitted with the best feather, and cushions laid upon them; the kitchen was very hot, and all officers at work for provision; the table is spread with all dainties, and the cups fill'd with Wine; fat and cramb'd Capons, Peacocks, Partridges, Peacocks, Quails, Turtles, that feed on figs and grapes, and those birds that have two hearts to set them forth come flying to the table: Turbors, Gift-heads, Sturgeon, are not worth speaking of. The stool-filh of Campania with purple juice, and Oysters from Abalans and whatsoever the whole ocean can afford, are ready. The Wines are white, black, red, purple, sweet, delicate, sharp, Cecebuns, Falerums, Chins, powered forth in full bowls. To fay nothing of the second table brought from Tatrum, and the dainty cares, with Rohe, Violer, and facinh coloured. Lastly, no delights, dainties, pleasures, or joys are wanting, that the rich Gowns (for she is daughter to Bacchus and Venus) with her fifters, the hand and knee-gowts, may be entertained delightfully. The Spider also is good hap was, light upon a poor Cottage instead of a rich pal, and there she teacheth man and wife what duties are useful for both, and fars her fift with care. But perhaps some man will object, that they can find no good fortune in this, but only the Spider may be commended for changing her habitation and her holt; but it is very fortunate for her: for the lives not only safer and more at rest, but the doth not from the roof as from a watch-tower, behold any more adulteries, glutony, riotous prodigality, Lifeciousness, plays, dancing, woods, fights, pick-thanks, and Lady-thole vanities, and bell lines, that never enter into poor men's cottages, whereof the she knew her fift to be guilty, while she lived in Courts and Palaces of great men, who so soon as they had driven forth the Spider, (the mistrels of labour and frugality,) were presently filled on by the Gown, and not only so, but all luxury, dillembling, lying, flattering, pride, entered into their palaces, or rather into their ears, eyes, and minds, and polluted them with all wickedness and companions of all mischiefs: were it not better for Kings to allow this good, frugal, wise, harmless little creature a room in their large chambers, than to hear it, and to reward it so much such pick-thanks, and Court-flatterers, and voluptuous persons, who by their wicked counsell and example will quickly corrupt the best men? I know not whether I were bient commend the Spider for the gifts of her minde, as wisdom, justice, valour, temperance, humanity, love of poverty, love of works, sufficiency, cunning, cleanliness, and her other vertues; or else her admirable art and skill in weaving her Webs. Her wisdom appears in that, that when the Rivers are like to rise higher, and drown her house, she removes to some safer place. In fair weather when the Flies fly about, they weave not, but wait on their prey: she runs away at the least touch of any thing that troubles her, and hides her head in her hole (as Vipers do) that she may feel the lefle pain, and that her body being hurt, (which is easily healed) yet she may preserve her head that governs the whole body. Who taught them to know this? Did any Chaldens teach them, by the situation and position of the Stars? No indeed, but the Spider hath a certain divine wisdom given her, as the Poet fang truly.

_Poefy of the_ Spider from the gifts of her minde,

_Her body moves by vertue of her minde_  

_Diffused in every part—_

Moreover, so soon as they see an enemy fall within their nets, they do not presently wound him, or bite him in a hostile manner, but they kiffe as it were and tickle him, until they have all smeared him over with a clammy web fetched out from the hinder parts with their hindermost feet, and have as it were bound him with bands, taking away from him all power of resistance, flying away or moving; then that thred being fastned to their web, they run to the centre to observe, if any prey may fall within their nets: and thus sometimes you shall see ten or twenty Flies hang upon a line on high, and the Spider will take them one after another, breaking their line they hang by, and fastned to one of the hinder legs, will carry them to the centre of her work, and there devour them: they feed on nothing but the juice of Flies, and when the car-kas is dry and void of all juice, they throws it down as an useless burden to her web. Moreover, because the female is something greater than the male, therefore she hangs under and observes, for fear the small creatures should percieve and take heed, but that they may fall unawares into her net, for by reason of her greater body she is not so fit to catch her prey. But the male is more active, and lies a top, as if he were otherwise employed, or else seeing all things from a very little hole in her net, she conceals herself that he cannot be seen. And when any by chance comes to his lot, how vigilant is he and intent after his game? for he will not let his prey escape, but he runs from the upward line to the lowest suddenly, and when he hath his belly full, he takes up the rest of his provants, and hangs them up by a thread to suck them another time. And when as by age the webs have lost their clammy quality to hold saft, the Spider either new weaves them, or else begleaves them anew and repairs them. Her work ended, she either contains her self in her hole; or watching above she holds the thread drawn from the centre, as it were with
with her hands, whereby she can go and come to her nets and retreat at pleasure, and also (if any prey be taken) she perceives it by the motion of her web. But to be more certain, before she comes down, she draws her thread back sometimes, that she may know how it is by motion and weight. Then first the hafteth to the centre; which the enframed little creatures either feeling or conjecturing, do lie still, left by motion they should discover themselves and be more entangled; yet they cannot deceive the Spiders who with feet and eyes perceive their prey, and run swiftly unto it suddenly. But good God! what and how great justice is seen amongst Spiders? None of them robs another of his wife, none of them enters upon another's house; each of them lives by his own labour and possessions, and they hold it unlawful to break the bands that belong their neighbours:

But men are not so just, oh pity 'tis to see
How covetous they are, lust reigns in each degree
Adding house to house, both seas and lands,
And more worlds they fain would have in their hands.

Farther, they do not pitch their nets for such creatures as are good, and useful, but to catch Hornets, One-flies, Hotie-flies, Wasps, Drones, Breezes, Gnats, common Flies, which are to us like bands, thieves, flatterers (as the Comedian speaks) that breed us many inconveniences, but are no way fit to do us any good. Moreover, the darts (as the is very valiant and magnanimous) hunt after the Lizards young ones, whom the presently involves in her nets, as they make resistance, then laying hold of both their lips with a deadly biting, she holds them so fast that she makes them dye under her. And lately like another Cactus she draws them backward dead into her lurking place. And if by chance in this great contest, she finds her nets broken or folded together, she presently repairs, unfolds, and spreads them anew with great dexterity. Farther yet, there is a fierce and everlastling feud between the Spider and the Serpent: for at any time the Serpent seeking shady places, falls upon some places under a tree where many Spiders, are, one or other of them will fall right upon the Serpents head with his net, and she will so beat upon his brain with her mouth, that he will make a noise and hiss, and be so vertiginous, that in this miserable condition, he can neither break her thread, nor escape from her. Nor is their end of this combat, till the Spider have destroyed him. Let the Romans be silent concerning their battaíls on the stage, and the cruel combats of Elephants, when a little Spider dares fight with a horrid and wan black Serpent; and not only to fight with him, but to triumph over him, and carry away the rich spoils of his victory. Who would not admire so great force, so great weight, so sharp and hard bitings, and almost incredible strength, in so small a body; and of no consideration, having neither bones, nerves, flesh, and hardly any skin? this cannot proceed from its body, but its spirit; or rather from God himself: In the same fashion they enter the holes with land and water Toads, and kill them in single fight. For not only Pliny and Albertini the Philosopher mention this, but also Erasmus in his Dialogue of friendship, relates how a certain Monk, who slept with open mouth, and had a Toad hanging at his lips, escaped by the assistance of the Spider. Oft-times also they enter the stage with the winged Hornets, that hath a strong sting, and fibres almost of horn, who straight by main force breaks through their webs, as great rich men do with the Laws; yet at last he is wrapp'd in a more tenacious glue, and pays for breaking open their houses, and conquer'd in single duel, he becomes subject to the Spider.

I must not pause by their temperance that was once proper to Man, but now the Spiders have almost won it from them. Who is there now (if age will let him) who will be content with the love of one? and doth not deliver up himself body and soul to wandering lust? But the Spider so soon as they grow up, chooseth their mates, and never part till death. Moreover as they are most impatient of curtsies, so they set upon any Adulterers that dare venune upon their Cottages, and bite them, and drive them away, and oft-times jetly destroy them. Nor doth any one of them attempt to offer violence to the female of another, or to assault her chastity. So great command have they of their affections, so faithful and entire are they in their conjugal love, like Turtles. If you respect their household government, what is there more frugal, more laborious, or more cleanly to be seen in the whole world? For they will not suffer the least thread to be lost, or placed in vain; and they ease themselves by interchangeal work; for when the female weaves, the male hunts; if either be sick the other supplies both offices; they may defend alike. So sometimes the female hunts, and the male weaves, and this at any time when the one wants the others assistance; for we cannot think them so void of mutual love, that living so faithful in Matrimony, the one should not lend a helping hand to the others necessities, and so by mutual concourse they continue their friendship amongst themselves. The female at home being now learned from her Parents to spin and weave (as she is wont to do with us) she begins her webs, and her belly contains all the matter of them, whether it be for that at a certain time her entrails are so corrupted (as Democritus said) or that there is a kind of woolly fruitfulness in her as there is in the Silk-worm. Yet Aristeue will have the matter to be without, like a thin shell which is drawn in length, by spinning and weaving; or after the manner of those that shoot out their brittle, as the Porcupine. However it be, they lose not the leaf
Of lesser living Creatures.

The variety of their Nets is so great, that it is not called amities, the Goddess of a thousand works; some of them are looser, some thicker, some triangular, others square, some Diamond figures, for the commodity of the swindling of hawking: But that which is round is commonly wrought between two trees, or Reeds, and oft times in divers windows, hanged with ropes, and fail-yards. Good God, what great reason, judgement, art, what admirable wildomne and beauty she shews! Truly we may not suppose amities, to say that Enicles learned to make his figures from hence, and Fishermen their Nets; for from whence else could they fetch such an example of so curious and laborious a Miftrefle? So finely is her work brazened, and made so round and exact, and so evenly balanced, and the work to the body in place of a weight and spindle, that she may well be compared with Minerva, but that the comparison makes me afraid. Alfo the work is fo firm, that though it appear fo weak, that it will hold Homers, endure force of winds, and being fallen into its, it rather yealds than breaks or is hurt. The manner of her Net-work is this: First she draws her semidiameters to the places circumjacent, most fit for her work; then, with no compayle, but by a natural skill of her feet, she makes 44 circles with her thread from the center: to the circumference, by equal parts more distant one from the other. Moreover that is worth our knowing, as also it seemd most admirable to our most learned Turnerus and Bruerus, namely, that those Spiders when they are purpose to fallen a thread from a high beam, in a right line to the earth, they hold a little stone with their feet, and then by degrees they let themselves down by a three doubled thread, that the angle at the earth may answer the angle above by the beam exactly, But that above all the rest is worthy of admiration, how they fall the first thread on the hither side of the River, and the second on the farther side, whereas Nature hath not taught them to fly, or to swim; I much doubt whether they leap over or not. The second payses in weaving they desyre, that be build on the rafts of houses, and other Field-ides, who upon the graffe weave a Net, that is broad, thick, and plain, and it is a Net indeed, set forth like a sail, or sheet. In the work of these Spiders, if you consider, the wind, the skins of yarn, the thread, the chaff, the comb, the wool, the ditaft, the web, either: you will see nothing, or you must see God incomparable, yet really performing all these things; and truly in spinning, they go far before the Egyptians Lydians, Phcenio, Tarsagis Athenians, Romans Claudians, Sabins, Frulas, and the Queens of Macedonians, that were wonderfully skilled in spinning, because (beyond all ordinary reason and art) no threads be drawn overwight, they make a solid and tenacious Web, of a strait continued long thread. Their work being ended, they snare it over with a biedilum glutinous snare, by the touch of which alone the prey is entangled, and pays for its bottom and waste of forright. The colour of her Web is aerell and transparent, or rather no colour, which is the thing deceives the Flies that are not aware of it, and they that see but hardly escape it. For had it but any perfect colour, they would think what need they to avoid it, and fly farther from it. The molt ignoble Spiders
Spiders, (namely, those that are sluggish, fat, and that ly in holes) make but a very courie Web, and groser thred by farre, which they hang only to holes in Walls. These have a more heavy body, shorter feet, and are more unite to spin, or card, they light upon their prey rather by chance than seek for it, because the hole is so great without; and seems a fit place for Flies to hide themselves in; but at the very entrance they are entir'd by the Spiders, and catcht, and are carried into the Shambles for Flies to be lamm. For they ly deep in Walls, that they may escape the Birds that ly in wait for them (as Sparrows, Red-breasts, Nightingales, Hedge-parrrows) and that they may the sooner entirre the Flies that suspet no harm. And for Spiders that are harmless, and for their webs, let this suffice: Now we shall add something concerning those kindes I have observed.

Chap. XIV.

Of certain kindes of Spiders observed by Authors.

You may remember that I did divide Spiders, that some were venemous, and called Phalangias, and others were harmless: Few of the Phalangia (and perhaps none) use to spin, but all the rest spend their time in making threds or Nets. Some of these Net-workers are House Spiders, others are field Spiders, and also are thoes that make threds distingified.

Amongst the Net-workers I saw one the greatest of all, I have set down the picture of it here. In Autumn amongst small Rose-boughs it extendeth an artificiall Net, and it catcheth either another Spider running over it or Gnats or Flies that come to it, when she pulls her cord with wonderfull dexterity, and when she hanged them thus up, she leaves them till the growes hungry again. She hath a frothy body, Ovali figured almost, it hath a little head with pinthers under the belly, and the back is adorned with white spots. This is one of the Annual Holes, and so a very short time it will grow from the bignesse of a Pea, to be as big as you see here described. Amongst the Web-makers, we have seen some spin a very fine Web, others spin one that was but moderately one, some spin base stuffe, groser, rude, and ill favoured: The most subtile work-masters are the Housebred-Spiders, whereof we have here set down one of a brown colour, of the bignesse of the figure, and being placed between you and the Sun, it is of some transparence. This is it whose commendation was written by Cælius Secundus Curious, and the nature of it by Pliny, which taught Hebra, Penelope, the Egyptians, Lydians, Macedonians and others that were given to spinning. This field Spider weaves a moderate and strong Web in hedges, stretching forth his sheet with a Coverlaid, and where he dwells he waits for his prey. His Web is thicker that it may not rain through, and better to endure the force of winde, the hath a brown body, but feet that are changeable colours, varied with black and white spots in order, the hath a forked mouth, fenced with claws, the two white spots that are seen above in the head I know not whether they serve for eyes, the whole body is gently hairy; the doth stretch out her Web wide and long, that she may catch much prey, to which she is very much addicted. This field Spider spins a base and unpoltithed thred, and gathers it as it were into a bundle. Pennius first observed this kind of Colchester fields between wilde Origamum watching for Flies, and he never saw it otherwise. It hath feet like to those described just before;
many young Spiders run forth, which go all with their Dam to feed, and at night they rest upon the Dam's back. Pennants supposed that this was rough with warts, until he touchd it with a straw, and saw the young Spiders to run down. Also in rotten hollow trees there are very black Spiders, with great bodies, very short feet, that dwell with Cheelsips, and Cater-pillars called Jull. Also GEFNER, we have seen them all white, with a com- pacted and broad little body, upon the flower of Mountain Parsley, Roes and grass, they have most long slender legs, he thought it was venomous.

round body like a Globe, the back is marked with white spots; also it hath a fundament four square, and black. Hitherto also we referre three kindes of the Spiders called Lups, who live in clinks of Walls; heaps of stones, and old rubbith: they weave a bafe and small Web in their holes, and in the dry time they wander farther abroad in hopes of prey, which they set upon with great forces, and draw into their dens. The greatest of them is of a brown colour, it hath a head almost of Globe figures, the body as a Globe, both sides are adorned with two small and short white lines about the middle of the back it is of more whitish colour, it hath feet comely with divers black and brown spots: The middlemost is the leaft, and grey-coloured; the ridge of the back is set forth by three Pearles as it were, whereas that which is next to the neck is greater and longer. The third seems to be blacker, wearing a Croffe overthrow the back very white, and with rightt angles, and therefore some call it the holy Spider. I conjecture that these are of the Wolf kind, because they run with a kind of leaping, and discover a great ravening appetite, for they lay up nought for the morrow, but consume all their provision in one day. GEFNER saw many young Spiders run forth, which go all with their Dam to feed, and at night they rest upon the Dam's back. Pennants supposed that this was rough with warts, until he touchd it with a straw, and saw the young Spiders to run down. Also in rotten hollow trees there are very black Spiders, with great bodies, very short feet, that dwell with Cheelsips, and Cater-pillars called Jull. Also GEFNER, we have seen them all white, with a compacted and broad little body, upon the flower of Mountain Parsley, Roes and grass, they have most long slender legs, he thought it was venomous.
Of the generation, copulation, and use of Spiders.

Generation.

It is manifest that Spiders are bred of some æereal feeds purified, from filth, and corruption, because that the newest hovels the first day they are whitened will have both Spiders and Cobwebs in them. But their propagation is frequently by copulation, the desire and act whereof lasts almost all the Spring. They do by a mutual and frequent attraction of their Nets, as it were kindle venery, and continually as they draw, they come nearer, then at last they copulate backwards, because that manner of copulation, by reason of their round body was most convenient: After the same manner do all the Phalangia that weave, copulate together, and they are generated from creatures of the same kinde as Arisitofes tells. But they copulate not in the Spring, but at beginning of the Winter; at which time they go fatfe, and hurt certainly, and seeme to be more venomous. Some after copulation lay one Egg alone, and carry it under their belly, and it is white as snow, and they sit on it by course, the male sometymes helping the female. Others lay many and very small Eggs, like Poppy-seeds, out of which sometimes thirty small Spiders are bred, after some wrilling sports in their Web, they go forth with their Dam, and in the evening they come in again, until such time as each of them hath learned to spin its own Web, to live more safely and pleasantly, they thrive forth their young by leaping, they sit on their Eggs three days, and in a lunar moneth, they bring their young to perfection. The House Spiders lay their Eggs in a thin Web, but the field Spiders in a thick, because they may resist the greater forces of winde and rain; the place helps much for Generation. For as in the Country of Arrhenia, and in the Island of Crete there are great store of Phalangia, so in Ireland there are none; they did not long indure in England, the Tower at Crtationali would sooner none, for though many of our Spiders swallowed down do hurt us, yet their bite is harmless, and no man is killed by it, but the bitings of all Phalangia are deadly. Where shall you not finde these Spiders that bite without doing hurt? They climb into Kings Courts to teach them vertue: they work in Noble mens Chambers to teach them their Duties; they dwell in poor mens hovels to teach them patience, to suffer, and to labour. Goet but into your Orchard, and each tree is inhabited by them, in your Gardens they hide in Roses, in the field they work in hedges, you shall finde them at home and abroad, that you may have no cause to complain that there are no examples for vertue and diligence every where. The Spiders, though Pallas called her impudent, Martial inconstant, Claudius bold, Politian pendulous, Iuvenal dry, Plutarch corrupt, Virgil light, Plutus unprofitable; yet is the good, and created for many uses, as shall appear clearly; wherefore adoring the Majesty of God who hath given so great vertues to so small a Creature, we shall proceed to speake of the profits we receive by them.

Copulation.

Thfe catching Spider wrap in a linen cloth, and hang'd on the left arm, is good to drive away a Quotidian, faith Trallianus. But better if many of them be boyed with Oyl of Bayes to the consistence of a Liniment; if you anoynt the arteries of the Whiffs, the arms and Temples before the fit, the Fever abites, and seldomes comes again, Kiramides. A Spider bruised with a plaiater, and spread on a cloath and applied to the Temples, cures a Tettn, Dsorides. The Spider called Lycos, put in a quill, and hang'd on the breast doth the same. Pliny. That House Spider that spins a thick and white Web, shunt in a piece of leather, or a Nut-shell, and hang'd to the arm or neck, is thought to drive away the fits of a Quarantine, Dsorides. Peninus faith he proved it to benefte, Three living Spiders put into Oyl, let them prefently boyl on the fire, drop some of that Oyl warm into the ear that is in pain, and it profits much. Or prell out the juice of Spiders with juice of Roses, and put it in with Wooll, Marcellus Empir. Pliny bids infue them in Vinegar, or Oyl of Roses, and ramp them, and then drop some into the ear with Saffron, and it will still the paine certeinly: Dsorides affirms as much, Sofratus med torque, faith, that Crescelaptes (a certain Spider) drowned in Oyl, is a present remedy against poisons, as the Schollett of Nicander profeelleth. Some catch a Spider with their left hand, and bruise her in Oyl of Roses, and drop some of it into the ear of the same fixe the tooth agin, and Pliny faith it is a cure. Laid upon their own bitez, and taken inwardly they help us. What should I speake of the Albugo of the eye, a molt hurtfull disease? Yet that is taken away very easelie by the help of one Spider, if you do but bruise the longest and slenderest feet (especially of that kinde of Spiders that are the whitest) with Oyl and anoynt the eyes affected with it. Pliny. Also the running of the eyes is stopped (which the Greeks call sponuba) with the dung and urine of a Houfe Spider droppt in with Oyl of Roses, or one dram of Saffron, or elle laid on alone with Wooll: whereby you may know that there is nothing so filthy in a Spider that is not good for something. Akim for supplication of the masters, applied a Cerate of Spiders to the Navells, and faith it did great good. Pliny faith, that Spiders help the swelling and pain of the gins, but he tells us not his reason. He faith moreover, that if any man take a Spider coming down with his threads, and bruised in the hollow of his hand, do lay it to the Navel it will cause a feafe, but if he takes him climbing up,
up, and applies him, it stops the belly. He writes also that a Spider applied to one that knows not of it, and taken off the third day, will cure a F felon. The head and feet being taken away, it helps swellings of the Fundament. The same Author. By the fume of Spiders all the Lice fall down and never breed again, Goose-grease and Oyl of Rofes with a Spider a noynted on the breaths, keeps the milk from curdine in them. Anonymous. Also that knotty Whip of Godman mock of all Physicians, the Gowr, which learned men say can be cured by no remedy, finds help and cure by a Spider layd on, if it be taken at that time when neither Sun nor Moon shine, and the hinder legs pulled off, and put into a Deers skin and bound to the paied foot, and be left on for some time. Also for the most part we finde those people to be free from the Gowr of hands or feet, (which few Medicaments can doe) in whose houses the Spiders breed much, and doth beautifie them with her Tapefry and hangings. Oh the rare miracle of Nature! O the wonderful vertue of a poor contemptible Creature! O most happy rich men, if they knew many of them how to make use of a thing ready to do them so much good! Antoninus Pius was wont to say, that the quirks of Sophiftry were like to Spiders Webs, that had a great deal of art and ingenuity in them, but very little profit. But how often hath the blood run forth of the body most miferably by a fresh wound, yet it had been eafe to have stopp’d it by laying on a Spiders Web, something thick, and binding it fast on, were we but more attentive to look to such remedies that God affords us in our houses. But we are greedy after foreign remedies, except from farre; as if they were better that we bring with great pains from the farthest Indies, or more healthfull because of their greater cost. But unlesse mad af fection did drive us, as if we were Gad-Hung, through all the places of Sea or Land, to finde remedies to stopp blood, cure Ulcers, hinder corruption, drive away inflammation, knit wounds, One Spiders Web would do more good than Serocollis Sandaracca, Bole brought from Armen ia Terra Sigilata, Argilla Sambia, Terra Lomia: For it bindeth, cools, dries, glutinates, and will let no putrefaction continue long there, wherefore it suddenly stops all bleeding at the nofe, (and the bleeding and they murr’d and blod’d in a Dyfe) by Menstrual blod and it over great evacuations of blod by the opening of the mouthes of the veins) whether you give it alone with wine inwardly, and lay it on outwardly, or else mingle it with Blood-tons, Curae Martinus and other things of that kinde. Also the Spiders web is put into the Unguent against Tetter, and applied to the swellings of the Fundament, it confumeth them without pain, Marcel. Emp. Also Pliny faith it cures runnings of the Eyes and layd on with Oyl it heals up wounds in the joyes. Some rather use the athes of the webs with Palenta and wine. Our Chirurgians cure warts thus: They wrap a Spiders ordinary web into the fashion of a Ball, and laying on it the warts, set it on fire, and to let it burn to ashes; by this means the wart is rooted out by the roots, and will never grow again. Marcellus Empiricus was wont to use the webs of Spiders found in the Cypreft tree, in a remedy for the Gowr, to cafe the pains, For the Tooth-ache, Galen 5. v. a. 1. out of Archigenes commends highly Spiders Eggges, mingled with Spike Oyl, and put into the tooth: Alfo Kiranides gives Spiders Eggges to drink against a Tertien; whence we conclude with Galen ad Pifon. From the Spiders we may understand enough, that Nature hath made nothing to vile, but that it serveth for its necessary use; if fo be Physicians would use more diligence, and would not disdain to enter into the wood of such things as are eafe to attain. Now I will proceed to other things, leaft if I stay too long in the History of the Spiders, I may indeed be faid to weave the Spiders web; yet I will add this that Munkeys,apes,Stellions, Lizards, Waips, Ichneumons,Swallows Sparrows, Muskins, Hedge-sparrows, feed on Spiders, And the Nightingale that is the chief of singing Birds is cured from some diseases by eating of Spiders. When Alexander reigned, it is reported that there was a very beautifull Strumpet in Alexandria, that fed alwayes from her childhood on Spiders, and for that reafon the King was admiffioned that he should be very careful not to embrace her, leaft he should be poifoned by venome that might evaporate from her by fweat. Aberta also makes mention of a certain Noble Mayd of Collem, that was fed with Spiders from her childhood. And we in England have a great Lady yet living who (as we faid before) will not leave off eating of them. I cannot butt into a history that I formerly heard from one dear friend worthy to be believed, Breraus. A luftfull Nephew of his, having spent his estate in rioting and Brothel-houses, being ready to undertake any thing for money, to the hazard of his life; when he heard of a rich Matron of London, that was troubled with a Timpany, and was fortaken of all Physicians as past cure, he counterfeited himself to be a Physician in practice, giving forth that he would cure her and all diseases. But as the cuftome is, he must have half in hand, and the other half under her hand, to be payed when she was cured. Then he gave her a Spider to drink, as supposing her past cure, promising to make her well in three dayes, and so in a Coach with four Horses he presently hails out of Town, left there being a rumor of the death of her (which he supposed to be very near) he should be apprehended for killing her. But the woman shortly after by the force of the venome was cured, and the ignorant Physician who was the Author of fo great a work, was not known. After some months this good man returns, not knowing what had happened, and secretly enquiring concerning the fcape of that woman; he heard she was recovered. Then he began to boast openly, and to ask her how she had obferved her diet, and he exculped his long abfence, by reason of the sickness of a principal friend, and that he was certain that no harm could pro-
ceed from so healthful a physic; also he asked confidently for the seat of his reward, and to be given him freely. Truly in this present corruption of manners and times, how highly is such a Mountebank esteemed, wherein chance is accounted for skill, and one accidental rash cure of a disease, with danger oft-times of the patients life, makes a Quack-surgeon a great Physician, and he is judged worthy of praise and honour? But a better revenging Judge will correct these things; we pass on to Pismires.

CHAP. XVI.

The commendation of Pismires; wherein we shall describe their Differences, Nature, Ingenuity and Use.

To begin with the commendations of the Pismires, I know not whether I shall first speak of their body or minds, since Ants for both are not only to be preferred before many Insects, but also before many Men; for they are not one eye'd, nor horrid skew-eye'd, nor do they walk with crammed guts, as Bulas cloth in Plantus, nor yet are they mithapen, crook-leg'd any ways, gout-bellied, over close knotted, bul-bulched, great mouthed, lean chaps, rude foreheads or barrets, as many great Ladies, and noble Women are, who have lost the faculty of generation; but the beauty of their body follows the goodness of their minds; and nature hath given them for their degree and order, a constant and absolute perfection. Cardan was the first said they were blinders, because their body is small; not remembering that there are many Flies and Gnats that are far less than Ants, yet they have eyes and can see well. If they were blind, I see not what the light could profit them, and they would work as well in the night as in the day; I confesse that their foreyards serve them for a staff to prove the way, not that they do not see what way they go, but because by those means they try the hardnes and softnes of things. They have a very little head, but round as the heavens are, wide brain'd, set with eyes, a mouth with teeth, and a throat not without a tongue and a palate; they have a square breath with ribs to defend it, with lungs, or bellows that supply their room, that are so firm, and yet loose, that they never grow out of windes by labouring, but always draw their breath moist freely. They have a stomach in their belly that is strong to digest venomous, (for they feed often on Serpents and Toads) and they are very hot in the matrix, and very fruitful, to their commendation. What should I here mention their swift walking, and their equal motion when they go? for they not only out-goe pack-horses for the proportion of their bodies, but run the swiftest Charriots. They vary in colour, according to the difference of their kinds and places. For there are red ones in Mauritania, and the inhabitants of Budemelium have white ones. In Europe they are most an end black ones, yellow, and somewhat red from tawny. Here they seem very short, smaller, fine necked, slender, and weak bodied; yet these will carry a weight thrice as great and heavy as themselves; and those in India of a great bignesse, will carry great pieces of fleith with them, and devour it.

Their praise is not only for their bodies, but for the excellence of their minds, which stand in proportion to their bodies, as wherever we meet with the visiblity of a great man, we see that he is set in a body that doth become him. Truly, as often as I remember the profudens of Caius Julius Cæsar, the luxury of Caligula, the prodigality of Nero, the excelsive glutony of Apicius, and the great wealth of Heliodorus; so often do I exceedingly commend the wit and ingenuity of the Pismire, and prefer her patience before that of Men. I know that they lived tightly and with far patrimonies from their fathers, they gained large inheritances; yet they found out new use of baths, dangerous kindes of meats, curiosity in banqueting, love of gold and pearl, flowers, in all who passed among them, and especially in the Pope, who made a new use of baths, and stood often in one and the same bath, as many as six times in the same bath, and was so particular about his apparel, that he would not go, but that they should be fit to be seen, and that no one should see him, but that he should be seen by all the world. In the same way, the Pismire, who is the most virtuous kind of Ant, and whose name signifies not great, but humble, is the most natural kind of Ant of all, as Cæsar is of the Romans. And (Oh God!) faith the Comedian, what a miserable thing it is for a man to have had a great estate formerly, and to have nothing now? how much better were it for us to imitate the Ant, who gathering corn in Autumn, doth not weigh it prodigiously in Winter rioting, but keeps it providently for future use, and daily store? Hence it is that she is never tortured with hard poverty, nor is she tossed on the billowes of croft's fortune, nor is she endebted or in danger by borrowing from others; nor doth she seek from other creatures either work, or sufficiency to maintain her, and keep her in health: and if frugality comes from fruits, as the Etymologist derives it, (for our Ancients, the Meters of old sobriety, scarce knew any other diet) it is very credible that that virtue is puffed from our first parents into the Pismires, who feed only on dry corn to maintain their lives, and avoid all superfluity of many dishes. Hence the Poet elegantly feigned that the Myrmidons, the most excellent people of the Greek Nation (if you consider their temper-
temperance, their labour and their diligence) were defended by the Pilgrims. For whence could they have gotten so great abundance of riches and goods, unless by an Emigrants prudence they had preferred what they had gotten and laid up to prevent poverty? And as aspiring in keeping so diligence in getting, and wisdom and industry is found to be admirable in them. They take a very commendable way first to preserve their life, then for their politty, and lastly to provide their victuals. First of all, they build themselves an house, as in the golden age, not covered with tiles for delights, but with green turf, and not made of bricks, but fenced with mud-walls. Histories do mightily magnifie the Pyramids, and breaches of Eggs, and the Labyrinth of Crete. But no man can sufficiently set forth the excellent work of breaches that the Ants make, the figures, the magnificence, the turnings, windings, and revolutions thereof: for these by an unpeasable prudence, beyond all mans art, make houses under ground with such strange turnings, that they open only the way that is inaccessible to others, and is not possible for any that would do them wrong to enter at. First they make the earth hollow with their tender nails in the place of spades: and to throw the earth forth they use their hinder feet for thowels: hereby they call up a mount, and fence it about as with walls or forts; then they cover their work with chaff, straw, leaves, bowes, bark and pieces of sticks, and laying on new matter, they raise a tower that may be seen afar off, (called an Ant-hill) which is far higher and more sloping than the foundation, partly that their houses may not fall by rain falling about them, and partly that they may live the more healthfully by reason of the air that penetrates and pulleth through. This divine little creature fetcheth the fashion of its building from heaven, either because their multitudes required room, or their excellence required the best. The entrance is not right forth but turning with many labyrinths and mazes; they distinguish their chambers in this tower of theirs in a threefold order, yet it is so hard to come into them, that Argus who was all eyes, may be often deceived in them. The first room is large enough, like the Presence-chamber, where they all meet, and converse, we call it the universal Congregation house of Ants: under this for the females, there is the feminine room arched by Daddlean Art, wherein the eggs are laid safe that they may produce their young ones, it is made left they should be thought careless of politty. The third chamber is most inward, and most safe from showers, and that is built for their store-house for their corn, that as it were in a granary they may lay up their belly-timbers, and may main it well from the winter cold that searcheth into all things; the adjacent parts and outward skirts of their castle they appoint for a place of burial, and there they bury their dead with honour and state. And this is the manner of their buildings, plain indeed, and within the ground, as are the houses of the wise men of elder times, before that pride, and the head-strong ambition of Ninas invented to build upowers to heaven. Since his death, shall I speak of Kings or Princes? Truly there are some Citizens of the lower bench, who with extraordinary charge do build up, not an Ant-hill, but Manseleam, or a prison for their bodys, and adorn it with all the cost and art they can; worthy they are indeed to be devoured by Pilgrims whilst they live; that dying by the force of a wise Creature, they may suffer for their folly. Nor do Ants build houses that are places for idle people, or such as are mischievous to harbour themselves in, but every one, yet without any Commander, followes some honest labors, and for the good of their democraticcall state each one mutually employs his pains by turn. For they all like thosse that labour in the Mines, do honorably exercise themselves in digging of trenches, stones here to repair their houses, to adorn them, and to keep them clean, others with great assemblies and tanctall solemnities bury their dead, in the place of burial adjacent, others again visit the sick, and out of their Granary they fetch some Physicall grans, (for they have Corn and grain almost of all plants) and prepare that and carry it to them. They have Officers of all sorts, as Purveyors for Corn, Gleaners, Stoners, Yeomen of the Larders, Householders, Carpenters, Masons, Arch-workers, Pioneers; for such is the verity and skill of every one, that each Ant knows what is needful to be done, and willingly doth his best to help the Common-wealth. But in their ordinary work what labour and diligence do they use? If they be minded to build an Ant-hill presently, or else are forced on a sudden to raise a new house, the old one being undermined and decayed by the Moles digging under them, they go forth all in troops, and from the rubbish of their houses thrown down they build new ones hard by. First they gather together their scattered Eggs, and Corn, and put each of them in their proper places, afterwards they repair their hill, and covering and thatching that well; they keep all safe and dry: when the Sun shines, when they go forth to fetch Corn, the greater and elder go before them as Captains, the rest follow after. They creeping up to the top of the wall, bite off the ears of Corn, and the young ones lay and gather them up, and the Chaffe being fallen off, they pull the Corn out of the husks, and then they carry it home; and the end of it being earen off, if there be necessity, they set it at their doors a sunning; and when it is ventilated they lay it up again. When gleaning is done, they frequent the thrashing floors, and there not by heath, but openly they take subsistence for their lives; and they enrich their treasury. Which labour of theirs Virgil wittily describes in these Verces.

As when the Ants plunder a heap of Wheat,

Minding cold Winter, stow it up for meat.

Their
Their black Regiments through narrow ways pass,
And carry their prey over fields of grapes.
Some bear the burden, some them forward drive,
Cheating delays, who shall work most they strive.

Wherefore not unfruitfully did the Prince of mortal wildness, send those flagitious and loothaft Monsters of Mankind (who like Mice live always on other men's labours, and goe from door to door like Vagabonds to beg a peny) to learn wildness of the Ant, that by the example of the Ant, they may use opportunity, and lay aside begging, esteeming labour much, which is the Merchant for all that is good. Hitherto belongs that of the French Poet.

Poor Sluggard who doft live in penury and want,
Behold the household prudence and wisdom oth' Ants,
Left she should stand in need, which she doth greatly fear.
She gathers in one month, to serve her a whole year.

This is their diligence in gathering, their care in preferring, their prudence in storing, their economical skill in distributing what they have laid up. I shall shew you also their modesty on the way, which me thinks should not be over-palled. For though they go in a narrow way, yet are there no brawlings, contentions or strivings for its, nor yet any murmuring, or fightings, or slaukiers amongst them for places (as it is usually amongst proud men,) But the younger gives place to the elder, and he that carries no burden, to him that is loaded, and each of them is ready modelly rather to palle by an injury, than Walshiply to offer one. If any man compare their burdens with their bodies, he will confede that no Creature hath more strength considering their proportion. They carry their burdens in their mouths; the greater burdens they attempt to take up backwards with their hinder feet, and lay their shoulders to them with all their might. They have all care and mindfulness and endeavours for the public good. They store up the feed they first bite, left they should grow again in the earth; when they are subject to grow mouldy, and are wet with rain, they bring them out and dry them in the Sun, wipe and torch them, and then they lay them up in their Granaries again. The greater seeds they divide at the entry. They work also at the full Moon in the night, (as good Mowers are wont to do) and when the Moon is in conjunction and hid, then they forbear Labouring. But what pains do they take in labouring? How diligent are they? And because they work in divers places, to come home with it, the one not knowing what the other doth. Certain days (faith Pliny) are appointed for a general survey, and meeting to enquire into the buisnisse, what running together of them is there then? how civil is their conversation? how complimentally do they salute one the other? how diligently do they seem as it were to talk together, and to make enquiry? You shall see fee Flints worn in the path they goe, and a path made in Marble stones, that no man may doubt but that diligence will doe something in any matter; for they all goe almost in the same path. For if one carry a burden too heavy for him, the rest in the way will come and help him, lending their legs and shoulders, if it be a light burden the fewer come to assist; if a weighty, more come, and either draw back, or thrust forward, or if the burden be too great, by biting it in sundry, and dividing it, they promote their buisnisse: And by this means they bring home a great heap of straw and sticks to their houses. Now if any will attempt to hinder the Ants in their labours, (as the Serpents and Toads often doe when they meet them,)  

They fight and will not flee,
And hold it noble in these wars to die.

For then (making as it were an agreement) they conspire together, and with horrid and cruel bitings, they destroy the enemy. He that hath not fastened upon the common enemy, thinks he hath deserved little of the Common-wealth, and upon that score they fight. In the time of harvest, when such an accident falls out, they do not meddle with a dead body, but presently as the enemy is vanquished, they fall to their labour again, and they gather again the Corn they laid aside before the battell, and lay them up; for they hold it no prudence to stay to plunder, when greater buisnisse doth require their industry, and they hold it ignoble to concile with those that are dead. They feed chiefly on grains of Wheat, Winter Corn, Barley, and hard meat which they delight in. They take great pleasure in Cyprus Nuts, and the tender flowers of herbs that are red. They eat Scorpions (called Geraret) faith Rhobes, and they feed on the Carcasses of Serpents and Frogs when they are hungry. Otherwise they abhor to eat corrupt and venomous things; nor will they touch fruit polluted with Menstrual blood, nor taint of them. Have not men by reason of hunger been compelled to feed on Horses, Wolves, Serpents, grasse, and dead bodies in time of narrow fiesges? That is sufficient to prove their cleanliness, that they carry out their dead in the husks or bladders of trees and Corn, as of old time the Romans buried their dead in pits, but they now carry them forth on Biers. They delight to live in clean houses, and for that purpose they do not lay their dung (that is
CHAP. 16.
Of lesuer living Creatures.

like to Urine) within doors; and when they travel through dirts, and are bedawbed, at the entrance of their houses, they rub themselves clean against some rough bark. They love and take such care for their young ones, that they always carry their Eggs in their bosomes, so long as they are little, and not so overgrown that they hinder their Labour; but then they lay them up in their deep hollow Caves, that they frustrate the birds that prey upon them, as the Wood-pecker, the Nightingale, and also the Bear. But so soon as the young Pinfires come forth of the Eggs, they immediately shew them the way to Labour and take pains, and if they refuse to work, they will give them no meat. Hence you may observe that they let every one his task: The stronger with their mouths, feet, little noses, do call up the earth, and when they have it call forth, they make it up in heaps, when they heap it up, they mingle straw with it, that it may lie light, and lie hollow. The wiser sort of them do build, the lesfer of them remain in their trenches, and work, the more expert make windings like Mazards and Labyrinths, and frame vaulted Chambers. If they observe any to be idle, they not only drive them out, pinched with famine as a bale breed, but they bring him before the door, and calling a Council of them all, they put them to death, that their young ones may take example, that they may not heither addect their minds to sloth and idlenesse. The days appointed for labour and gathering Corn, they let venereous action side; and chiefly in Winter, (when there is neither fowing nor mowing) they couple together; yet for modesty they let use venereous actions within doors, as the Bees do, at this time they make much of their Females, and when they are great with Eggs they embrace and love them most. Above all they take care (O wonderfull love to their young ones) that nothing may be wanting to their off-spring for food or instruction. He only can doubt of the valor of Pinfires who never saw them fight, nor heard the report of their battells. For they are not only full of choles, (as the proverb is) but they have a purpose to fight, so that they either joyn battell with externall enemies, or else hold civil wars amongst themselves, when they want food. For though Pinfires never fight when their Granary is full, and their Democratical Government stands fast whilst they have plenty of food; yet (what we read to have hapned in the belt ordered Monarchies) in a dearth, or rather want of provision, they fight despairly for food, and for their lives, and the lefser of them will rebel against the greater, (as being the greater gulsps of the Common-wealth.) If it be the nature of necessity to give and not to take Lawes, and then chiefly when the belly a troublesome Client, doth feed on it self, and the guts croke and are empy. There are few juiter Kings then 

Lyceolcoun was said to be, nor were there better Subjects then the Athenians, yet both of them did many things disorderly in famin, and he gained thereby to be branded with the name of a pullulent dishonourable Prince, and they of rebellious Subjects. Therefore this warre of the Pinfires is to be commended, that is not undertaken for a Crown of Ivy, Bayes, or of Gold, or of Grafe, (which was accounted the moit ancient) but from intestine necessity, and nature leads them to it: for neither could Solon himself endure thirst, nor Solomon conquer hunger. For these will dig under all walls, will be held by no bands, and they only know neither Lawes nor bounds. 

Anna Silvius relates a strange history of this fight, lib. de Europa. c. 50. His words are these, In the Country of Bononia, many little Pinfires that were hungry, clambered up a dry Pear tree to seek for food; the greater Pinfires came upon them in no small number, and these took out their mouths, and killed some of them, others they threw down, those that were cast down returned to their Ant hill, or fort, in the way they met with others, and seemed to talk with them, and rip up the injury they had received, and they bring forth all the forces they had, and their companions out of their tents. About two hours almost afterwards, so many bands of the leffer Pinfires, and such a mighty Army drew forth, that the whole field appeared black by these black fouldiers; they came all well guarded, and compassing the stock of the tree round, they began to climb up. The greater Pinfires when they saw their enemies at hand, drew close into a body to receive the encounter aloft; so soon as the Armies met and fought, the great ones killed abundance of the leffer ones with fierce biting them, and they destroyd all those in a terrible skirmish that first ventured up, that at the root of the Pear-tree there lay a great heap of them flyen. The rest of the little Pinfires and the middle Army would not be daunned by this, or run away, but they recollected their forces, and attempt to revenge, and folloging more swiftly, and piercing one Army after another, they mouned up the tree in greater numbers than before, and they bite their enemies on the back, on the sides and in the face, and they forced them to yeeld, and leave the tree. The greater Pinfires were much too strong for them, but the numerous multitudes of the little ones prevailed against them, and threw them at least fet upon one. This happened when 

Engein the fourth was Pope, Nicolaus Pifforinens a most learned Lawyer standing to behold it, and he related the manner of the fight sincerely and truly. Olaus Magnus reports the like accident to have hapned at Upsal and Holme, before that barbarous and cruel Tyrant Christopher the second was driven forth by the Inhabitants of Sweden from ruling over the Gnaus and Swedes. In which battle that must nor be forgotten, the leffer Pinfires after they had won the field inforced the bodies of their fellows, leaving their enemies exposd to the Crowes and Muffins; also they made choice of a high Tower for the place of combat, as if they would with a clear voice call and draw into them the prodigy of Tyrants and his followers, to see their deftiny
deflthy revealed, and the punishment that hang over their heads. Also they hurt Elephants and Bears, but not unlesse they be first hurt by them. They affliet Serpents and Dragons and make them mad, but it is either because they hinder them in their labour and stop the way, or because they breath their venomous breath into their caves and turrets. Grasshoppers and Dormice they hate exceedingly, those because they spend the Summer time in singing, these because they lose the Winter in sleeping, for a Common wealth well regulated doth punish idle persons as well as those that are wicked, and the Spartans were wont to call forth those that would not labour. They live very long, and would hardly ever die, unlefs the Birds did catch them before their time, or the floods and waters drowned them. They are for the most part very healthful, because they observe those three rules of Plato very exactly, mirth in labour, temperance in diet, and sparing in venemous actions. For what creature labours more cheerfully, diets more moderately, or did nature ever produce that is more temperate in venery? Also there is in them many seeds of demeitick discipline, justice, friendship and other virtues; and had we the like, either by nature or by art in us, we would fcor to live betely on the labours of others, and we would refuse to be slaves to our helies. Moreover they have some sense of future things; for before a famine they labour exceedingly, continuing their work night and day, and every where laying up a great store, as Juvenal hath it Suet. 6.

---Hunger and cold away drive, And from the Art learn to an art to thrive.

Since therefore (to wind up all in a few words) they are so exemplary for their great piety, prudence, justice, valour, temperance, modesty, charity, friendship, frugality, perseverance, indolency, and art; it is no wonder that Plato in Phaedo hath determined, that they who without the help of Philosophy have lead a civil life by custom or from their own diligence, they had their souls from Ants, and when they die they are turned to Ants again. To this may be added, as I related before, the fable of the Myrmidons, who being a people of Eging, applied themselves to diligent labour in tilling the ground, continual digging, hard toiling, and constant sparing joyned with virtue, and they grew thereby so rich, that they passed the common condition and ingenuity of men, and Theogonius knew not how to compare them better then to Pifmires, that they were originally descended from them, or were transformed into them, and as Strabo reports they were therefore called Myrmidons. The Greeks relate the history otherwife then other men do; namely, that Jupiter was changed into a Pifmire, and so defowered Eurymedusa the mother of the Graces; as if he could no otherwise deceive the bell woman, then in the shape of the bell creature. Hence ever after he was called Pifmire Jupiter; or, Jupiter King of Pisniures. For the generation of Pisniures are endowed with fo much virtue and justice, that they need no King to govern them, for each of them can regulate his own passions; or if they have any King, it is the Supreme Jupiter, that governs all, who is deerevedly thought to be the Fountain and Author of all virtue both in Men and Pisniures, and all other creatures. For there is none among men that doth govern better then the Pifmire; and we that shoul teach them (as faith St. Hieronymus) may learn of them divers things that are necessery for our souls and bodies. For when contrary to their nature and industry they hide themselves, we are certain that rain is not far off; and when we see them running here and there, and carrying their eggs before them, we are warned thereby of great winds and tempests. Also those that are well acquainted with Country learning, when they see the Pifmires run here and there, extreme faint, twice as much almost as at other times, and take such huge pains in gathering and boring up Corn, they are warned of a famine at hand, and so buy up all the Corn they are able. For they more rightly and certainly by their naturall magicke forethrew Tempests, then our Soothfaying Almanack-makers, that are derided and exploded for vain fellows by all godly and truly learned men. For let Emium be heard;

They that are our shee other men the way, And promise riches who have none to pay, To whom they promised to them they pray.

Nor doth Accius effe elegantly describe them, who was the chief in writing of Tragedies, in his Atticis we read thus;

I trust no Witches, who have learn'd the skill, With gold their bowers, others ears to fill.

They do better in my opinion who observe the Pifmires, and grow rich by following his manners in labor, industriy, rett and study. We read of Midas that he was the richest King of all the Welt, and when he was a boy, the Pifmires carried grains of Wheat into his mouth whilst he slept, and so forethrew without doubt that he should be endowed with the Pismires prudence, and should by his labour and frugalitie gain fo much riches, that he should be called the Golden boy of fortune, and the darling of prosperity. Achias. And when the Ants did devour and eat up the live Serpent of Tiberius Caesar, which he so dearly loved, did they not thereby give him sufficient warning that he
Chap. 16. Of lesser living Creatures.

he should take heed to himself for fear of the multitude, by whom he was afterwards cruelly murthered? Suetonius. They do teach us by their example of labour and virtue, both because they do inculcate unto us parsimony and perseverance, and also because when they are grown rich they maintain perpetual and inviolable friendship. For though at such a time one man is a wolf to another, and the desire of having more increaseth with gain, (which the Greeks call *mnestia*, Covetounes) yet as the Comedian speaks;

In good or bad what ert it be,
The Ant with Ant doth full agree.

And they never fight and jar but upon occasion of extreme famine. Horace chargeth them with Covetounes, because they always heape up more; but since they do that for the common welfare, that reproach of his is not their fault. But they eat Serpents, and live sometimes on venomous things: I grant that, and may be they use it for their Theriac, and are not therefore Pismires to be commended? Yes as well as the Storks, they ought to be fed from the common Treasure, and I might say to be adored as well as the Indian Rat Johnsonum. In Thibon the Priests sacrified Pismires to the Sun, either because they thought the Sun the most beautiful, and therefore they would offer unto him the most beautiful creature, or the most wife, as seeing all things, and therefore they offered unto him the wilde creature. But you will say, they are most hurtful creatures to Vines, to Dittany, to young shoots, and to many tender plants, and Pliny calls them the plague of trees. But Gellius calls them properly the revengers and judges of idle people; for by their labour call us out of our lurking holes, and drinking houes, to till our grounds, and take care of our Orchards more diligently, and to exercice our wits, and to be more industrious in our busines, and to do what is just and equall. Go forth then idle companions, and powre on a little hot water wherein lime hath been infused, and believe me not, but you shall drive all Pismires away, and shall infuse more life and spirit into all thy plants. Origium, brim-ffone, Afa, Nitre, Smalls-sheils, Lupines, Lacerwort, wide Cucumbers, Bals-gall, boyl, and caft on, or but in fume or sprinkled: also many things there are ready to be had for one that is diligent and laborious, whereby you may quickly drive out this plague from your grounds, and you may expect a great retribution for your pains, abundance of fruit. Moreover all those things that drive away Walfps and Hornets, that we spake of before, will afford you a sufficient remedy, and will also kill all the Pismires. Yet in truth, thou sluggard, thou hast more need to nourish this creature and fet up for it a statute of gold. For so of old time they are said to have done, when they worshipped the Ant, in an hieroglyphick, holding three ears of corn in the mouth of it, as being an emblem of divine providence, and labour, and of household care. For they are, to use Aristotle's words, without any King, and under a popular government; yet every one of them is for himself a father of his Country, and they do to their power increase the common good as if it were for themselves in particular. But if you object, that the Pismires by biting caufe redness, tumour, tickling, and then a grievous pain where they bite; I do not wonder at that; I rather wonder at this, how thou canst look upon them, and not blush extremely, for thou canst not chuse but bluse to see such great industrious in so small a creature, and to behold the watchfulness, labours, journeys, sweat, and toil that he is buffetted in. Yet they do not wound idle people so much (whom alone they are said to flinge) but it will be cured with an Emplater of *Varignanus*, made of Flies and Pismires mingled together; for as Scorpions, so are they the remedy for the wounds they make; and they bring their cure along with them when they bite. Pliny, Columella, Arvalus, Elianus, Albertus, and Vitalis, will direct you in other helps, but you must not draw them out and apply them, without using the prudence of the Pismire. Will you give me leave to reckon up the infinite benefits you may receive from them, for this small detriment you accuse them for? Now let what the Ancients write concerning the virtues of them, and judge uprightly concerning it. For they are not only meat for Serpents, Dragons, Bears, Locusts, Rats, Dormice, Chameleons, Lapwings, Woodpeckers, Larks, Nightingales, Pheasants, Wagtails, Hens, sometimes to satisfy their hunger, sometimes as remedies to cure them of surffets, as Pliny, Solinus, Plutarch, Palladius, Euthimius, Bellinian, Albertus, and experience do witness: But also the inhabitants of the Country of Mani, do feed on red Pismires seafoned with Pepper, and they are their greatest dainties as Nicolas Venetus doth tell us. Also they are good to catch Locusts, and to bait for many fishes, chiefly the Roch. As concerning Phythick, there are but a few diseases that these creatures, as the hand of God, do not yield some help unto. Doth a Beaver burn and scorch thee alive as it were in the Engine of Perilla? hearken and I shall tell thee of an admissible water to quench that fire, and most effectual against it, as Glycer received it from a friend: Take fountain water one pound, honey three spoonfuls, flask them in a can, and set them in an Emmets hill, so that Pismires may easilie fall into it when you find that so many are fallen in as will thicken the water, shake the Can, and as you use to do in making Rose-water, fo distill them. The dos is half a spoonfull, or more as the Patient can endure it by reason of his force more or lesse, it will wonderfully provoke vomiting, and will also evacuate the matter of the diseas by Urine. Pliny is the Author from the old fayers, that a Quotidian, Tertian, Quartan, and all intermitting Fevers will be cured, if the fiek caufe the parings of his nails to be cut before the entrance of the Ant hill, and if he catch the first of them that layes hold of them, and bind him up and tie him about his neck. Art thou troubled with pains in thy ears? go to, fill a glasse with Emmets and Emmets eggs, and (lop it well, and bake it in an Oven wch
with the bread, till it be as hot as the bread that begins to heat; then shall you find a water that is very usefull to cure the pains in the ears if it be dayly dropped in. Is there a cloud before the fight, preface the juice of the red Emmer, and drop it in, it doth corrode with some pain, and wholly extirpate it. *Erosia, Trudula, Theophrastus.* Emmer's eggs beaten and put into the ears, remove all deafnesses quickly. *Marcellus.* Some bruife them and prese out the watry substance, and drop it in. Some infuse them in a glaffe vesell in Oyl, and boil that on the fire, and powre that into the ears.

If Urine be retained and caufe the *Dropsie,* drink twenty Pifmires, and so many egges with them in white wine, and they shall help you. Alfo their egges diluted do much when Urine is stopped. *Leo, Pervontius.* A Maid that cares for her beauty, and would make the circles of her eye-lids black, Emmer's eggs bruised with Flies will perform that, and give them their desire. Some again either through age or disease (to ufe the Poets phrase) are beaten in their property, and have loft their generative power, that they cannot do the office of a husband if they would. Some Authours commend to these oil of Sefium with Emmer's eggs bruised and fet in the fun, if the yard and telhicles were anointed with it. To this oil some add Euphorbium one scruple, Pepper, Rew feed, of each one dram, Multifpiced half a dram; and again they let it in the fun. *Rafis.* *Arnoldus* in this cafe commends black Ants macerated with oil of Elder. *Nicollum* minglith it with roots of Saturny; and others do give the diluted water thereof to thoſe that are futting. *Geffier in Eumyrum* describes a water conducing thereunto: *Take faith he,* a pot bemerred within fide with honey, and half full of Ants, then add long Pepper, Nurmegas, Cardamon, Pellytor of Spain, one egglug, Butter what may fuffice, and digeft them fourteen daies in horfe dung, then dilifil them in a Bath, and give a little duly to be drank futting. Others, faith *Merula,* add Comfery to oil of Pifmires; others *Baras,* or root of Mafterwort with Wine when the impotent man goes to bed, and thus they affirm that men may be cured of feeble- nefs; and women of barrenness. But I wonder at the force of Pifmires in this cafe, for *Brunsfisulfis* writes that but four Ants taken in drink will make a man unfit for venery, and abate all his courage thereunto: yet he will maintain that Emmer with common falt and egges, and old hogs greale, wrapt in a cloth and laid on, will cure the pain of the Hip-gowt. *Marcellus* faith, that if they be applied with a little falt, they are a prefent remedy for a Tetters: Alfo as *Serenus* relates, they are good againft scabs and itch from an inflammation of blood.

The dust in Emmer's hit doth deep by,
Being mingled with oil, will help it by and by.

Alfo *Arnoldus* reckons Emmer's egges amongst fuch things as take off hair; and commends water distilled from them againft *Noni me tangere,* and all corroding Ulcers. *Albertus* thinks that drank with Wine, they do powerfully diffipate winde. Reckon how many Wars you have, and take fo many Ants, and bind them up in a thin cloth with a Snail, and bring all to ashes and mingle it with Vinegar. Take off the head of a small Ant, and bruife the body between your fingers, and anoint with it any impollumated tumour, and it will prettily fhink down. *Aronius.* Alfo God, that I may omit nothing, by the biting of Ants called *Solipagae* (it is a kind of venemous Ant) drove the Cyna-
molgi (a flourful and idle people of *Ethiopia*) from their habitations, and destroying them quite. *Flinys.* Some think they fhould be called *Solipagae,* but *Cicero* calls them *Solipagae.* I have a few things to speake from Authors, as from *Athenobius, Albinus,* *Natalia Comas, Diogenes Laertius,* and *Micheas a witty Book of the fame argument.* And *Aratus, Herodius, Strabo, Aristophanes,* *Rafis,* *Ag-
gregator, Broduz, Bifius, Zetius,* *Arnoldus,* have by the by run over the natures of them, and their polite life. But because they add but little to what hath been faid, I would no longer play the Pifmire, lefl seeming to be eloquent I might grow impertinent, and searching every creek too nar-
rowly, I fhould make more gaps. God grant that we whom God hath commanded to learn of Ants, when we are idle and mind nothing but our belles, may by his good guiding learn of them, and he instructing us, we may perform our duty. It is a small creature, and contemptible for its magnitude, yet we must know that goodnes is not in greatnes, but what is good is to be accounted great. I have faid.

**CHAP. XVII.**

*Of the Gloworm,* and the female *Melo,* and of *Antbremus* and the field *Chiflep.*

Oftimes those that are of a great faction, and of noble decent, will scorn to marry with one of a common family. Yet the Poets write that *Jupiter* did not disdain to imbrace ordinary women; and the Cicindela or Gloworm, and the *ol Betele or Melos,* (though they are of the winged order) are not ashamed to couple with others that want wings. And for as much as these females are endowed with the same force and dignity by nature, which is seen in males, *I know not why they should refuse or be weary of their chance, and of their females, when as (if their wings be taken off) they agree in the fame endowments of their minds and bodies.* We speak abundantly in the first Book, concerning their form, figure, manners, virtues,
Of lesser living Creatures.

Chapter XVIII.

Of Mineral Worms with six feet.

In Pennius his papers concerning the nature of Wormes, I did for a time wonder at his opinion, when he spake of Wormes in Stones, and he averred that he saw little ones with six feet in old rotten Stones. For he had received from all Philosophers, that all things that are very bitter, salt, sour, sharp, dry, hot, cold, hard, though they may corrupt in time, yet they will breed no worms, and therefore Theophrastus calls them Leues, not that they want life, but because they breed no living creatures. I began to weigh the matter narrowly, and to put into an equal balance, without fraud, all their opinions; at last I found that our Anceliers were here, and there most foully deceived, and I subcribe more to mine and Pennius his eyes, then to all their words. Tell me in good earnest, is there any thing more bitter then Gall or Agarick, saltier then the Sea, more tart then Leaven, more sourer then Vinegar, more hot then fire, or more pure and cold then Snow congealed? yet certain it is, that Wormes breed out of all these: and it shall appear sufficiently by the fequest of the flory, that Wormes are bred out of Stones, neither drinck, nor solidity, nor coldness, nor want of heat or moisture can hinder it: Nor will I allow of that, That Nature produces living creatures by a mixture of Heat and moisture, and moisture is a wayer as the matter for heat to make a concosition of. For not only where moisture affords matter, and heat both manifestly concot, are living creatures bred; but there also, (that we may not seem to fet bounds to the power of God) where we fee with our eyes that there is neither of these, nay where we may conceive that they are both absent. The generation of the creature called Pygogia in the flames, of Orites in the most frozen snow, shall evidently prove this, and that was the caufe that I sooner subcribed to the generation of Worms in stones. Moreover, they that with their graving tools, do make rough their Millstones that are grown over smooth by using, find Worms of six-times bred in them, as the Brother of Pennius certified. Felix Platonius, the worthy President of the Physitians at Bafil reported to me, that he found a great live Toad in the middle of a hard stone that was cold in funder, that was bred there. And that excellent man Zuingerus relates the same thing of a Scorpion. And indeed these things had seemd to me incredible and monitory, had I not known the same thing to have happened in a Quarry of William Cave a Noble man of Leister. And neither Philosophy nor reason is contrary to this opinion, since in the earth, the mother of all things, there is all kind of heat and moisture, and all kind of spirits; and (to use the words of a principal Physitian) all things seem almost to be

Z 312
Of Worms in Vegetables, that have six feet, and first of Worms in trees.

Worms in Vegetables are either Worms in trees, or in thorns or Pulses, or Corn or Herbs. The Tree-worms some of them feed on the wood, some on the bark, some on the leaves, some on the fruit, and of all these we shall speak in order. Those that corrupt the wood are of divers sorts, for those that breed in green and growing wood are called Salmone, those that breed in dry wood without sap, are called Sugana, those that are bred in solid and dry wood are called Thripes, those that breed in harder kinde of wood are called Termites, those that breed in saw-dust are called Coff, those that breed in planks of Ships are properly called Teredines. Salmone may it be took their name from Salmo, for they do bite and eat living trees, so that oft times about their roots a great deal of powder and dust may be seen, as it came by saving. This Worm hath an ill-favoured head, of divers colours, covered with a covering, and he can put it forth and drive it in the pleasure. His feet are on the hinder part toward his tail, as the Coff have theirs on their breasts, the rest of the body is covered with a sappy Coat, as it were their shell, and when they put that off they die, as Snails out of their shells.

In that time which Nature hath appointed they grow into a fishlike like to an Aurilia, but what winged Creature corneth from that afterwards I could never yet observe. This is far greater than Coffus, by reason of its unfairest eating, and is not so highly. The Wood-peekers and other Birds that spoyle the trees do make holes in the green trees, and by the sound finding out the hollow places, they dig and pierce in there, till they come to those devouring Worms, and they devour them. For they exceedingly delight in this kinde of meat, and for love of it they will sometimes spend whole days in diggings of a tree. Edaphus is found in rotten and hollow wood, which will make no noise though you strike it with a stiffe, it is very like to the Ceratgus in Theobryias, and the Pistocampa of the Physiologists, but that it hath only three feet on both sides. Geiger attributes it to a venomous and confolate evil smell, and a very corroding faculty. Thripes are thought to be named from terrando wearing, they are little Worms very frequent and common, their bodies are white, their heads black, or brown from red, with fix very slender feet near their necks and blackish with a little red like to the Worm in a Hazel-nut for the fashion of their bodies, but they are shorter and smaller in the middle; they love no black wood, but are bred only in wood that is whitish (as is the white sap of timber, Hazel-nut trees, Birch, Cinamon, the Plain-tree) and they penetrate into these when they are partly dry and solid, and drinking up the moisture they have, they make them rotten. I pass over the contests between Pliny, Hufchius, Theobryas Plineus, concerning the signification of Thripes, whereof some are so negligent, some so curious in observing the propernes of words, that in describing them they are very oblique, and as good as nothing. The Ancients used for Sealts, the wood the Thripes had eaten, and chiefly the Lacinianus as Hufchius testifieth. Whence Lucian in Lexiph. I keep them under sealts eaten by Thripes. For these Worms as they eat forward, do engrave divers characters of herbes, and forms of living Creatures, and so exceed the Divine sculpture of Phidian, Praxiteles, Myrmecides, Euroclus, Sephyrills, Antherurus. Galen speaks of a man that made Rings, p. 17. de usu part, who
who on the broad part of a Ring engraved exactly, to a wonderfull demonstration of his are, Physics with his Chariot and Horses, cast down headlong. But the Worm Teredo hath neither graving tool nor iron instrument, but with his solid teeth engraves most foul signetts, and frames wonderfull pictures of all things sometymes only by the conduct of Nature. When woods are dryed by overmuch heat of the Sun they produce and feed a Worm called Teremes, which as Servius saith, being bred out of the very wood, as left comems its mother, and will nee touch the hard barky substance. A very ungratefull little Creature, and so much worse then other Worms, the more it is hartfull to the heart and vital fountain of trees: For they live sometymes when their bark and hard wood is devoured, but when the pith is wasted they die presently, and Nature can never cure this wound. They are like the Cofis in shape of body, but they are farre late, and much fatter. The name perchance comes from Kis a Greek word, as if you should call it a Wood-weevle. For the Philosopher saith that Kis is a little Creature bred in wood, like Worms bred in Corn; the English call them Timber worms because they are seldome in any wood but that which is cut, and prepared for building. Their bodies are full of wrinkles, and hence some Roman Contuls are called Cofis. The greater Cofis are almost as thick as the little finger, and as long as three fingers broad, of a whitish colour, almoast like to the greater kind of Caterpillers; wherefore the great ones are called by Pliny Cofis. They have three feet on each side that are prouenous, not farre from their heads, short, flesser, and black. The body of them hath twelve rings, thoise toward their tails are always smaller and shining; their heads are somewhat thick, of a dark colour, and the nose is small, forked, sharp as a Spear, black, with two plates in the forehead, near the mouth there are small hairs that are pointed, all the rings in the sides are severall marked with red points, a little hollow. It is a Creature that crees very lowly, and the motion can hardly be perceived, wherefore Felis calls them Cofis, great belliess, and sluggish Creatures. He hath very little eyes, a round back, a belly something hollow, of a wathish whitish colour; they seem to be fat, and very soft; they breed in wood newly cut, but before it ought to be. But if they have been long cut, and have lost much of their moisture, the small Cofis only breed in them, that differ from the great ones only in bignesse. The Ancients in Pontus and Phrygia (as Pliny and Hieronymus note) fed on these as the most dainty meat, and for that use they fattet them with meal, that they might be fed Worms. Pliny faith they serve alio in phisick; for they heal Ulcers, increase milk, and in Ointments they cure creeping sores, which Albertus also confirmes. The Teredines have a very great head, considering their bodies, they gnaw with their teeth, and pierce into Okes, as you may know by the noyse: But Theophrastus thinks that there are only found in the sea, and men think there is no other Worm can properly be called Teredo. We remember, that in the Ships of the Venetians, that had long flound in the Havens of Alexandrius, those little ones were found, that were a cubic foot long, and as thick as a mans thumb, such as that famous Sir Francis Drakey another Sea Neptune brought home with him in the Ship that had gone over the world, and was grown rotten and popyony. We saw other Teredines in inch long like to Worms bred in flower; they have a red body, a yellow shining head, a little red, a forked mouth, from the lips whereof little thorny hairs come forth, they have three feet on each side, the incisions of their backs are eleven, something red: The rest of the body is of a watry yellow, and thines the greater they are the more darkly they thine, of a Crimson colour, and the smaller they are, the whiter they are. The Italians call them Elysam, the Spaniards Broman, from the eating of them, for they eat Ships, and penetrate them; whence Aristoephanes in Equisibus, brings in a rotten Galley, speaking thus, I being eaten by the Teredines am accusing for it. And Ovid faith thus, 1. de Ponto. It's eaten as a rotten Ship with Worms. By Peninn his leave, the Teredines eat not only Ships, but beans of houles, so the Scholiast upon Homer faith, (Odd. 70.) The words are thefe. Melampus whose ears Dracu had picked, that he might understand the voices of wild beasts, was cast into prison for the Oxen of Iphicetus he had driven away; where when he understood by the speech of the Teredines that there was but little of a main beam left, he caused himself fell to be brought forth, lest it should fall and kill him; and whilst he was lifted up by a man and a woman, and got forth, the houfe fell, and both of them were flyny. That is also apparent out of the chief of the late Comedians, when he brings in Philolachus a young man, speaking to them thefe words;

If tempest come, Teredo enters, And the rain at all adventures, Gets in, and ratt the walls and wood, Makes work for Carpenters, that's good, &c.

L 2 2 3

These
The theater of Insects: or, Book II.

Their hurt especially great trees, as the Oak, the Pear-tree, the Apple-tree, the Chestnut, the Larch, Walnut, Beech, the Medlar, the Elm and broad leaved Willows; in which cut intentionally, or planned, a soft and ill-fatty humour breeds (which Wood-men call, the sap, and the white) which is the matter and nourishment of all the Teredines. Trees that are then, more bitter, more oily and hard, are thought to be so much the freer from these Worms: yet sometimes they will offer violence to the Cypres-tree, the Walnut, the Quercus, the Tiele-tree, and to Ebony it will. The manner of their breeding in wood is thus: Many are bred within, and do not come from without, and they eat up their originals, that of what they were bred they may live by the same. The material and conjunct caule is the sweet moisture of wood that is fit for their nourishment, being corrupted even as of sweet flagm, Worms are bred in the belly, Now that sweet humour purgets from a twofold caule, either by diateme, or solution of continuity. By diateme the quality is corrupted, and by cutting not only the inbed humour runs forth, but some strange humour enters by rain and mists, and corrupts the wood. In old sponges, and dry trees, by reason of ages, are the greater Worms, both because the radical moisture is more diminished, and because the diateme, heat and moisture that are strangere, are more augmented: as oft-times old men are troubled with cruel Scabs, and eating fences, and Worms. Wood lying open to the Moon in the night, sooner breeds Worms, because of the over much moisture of the air, and in the hotter Sun, from too much heat. Those that breed within, breed at all times, but for those that come from without, and are bred of the seed of Gnats and Flies; the Spring and Summer are the chief times for them for they, since and age. Also the climate and the crookedness of great trees, for the third wood seldom corrupts, and they do such venture in the ground and in Arabia, in the climate. Now we shall describe the particulars.

Of those Worms, that are in Fig-trees, some are bred of the trees themselves, and another is bred withall, that is called Cerastes. For since the greatest part of Worms do differ in shape and form one from another, yet the principal difference amongst them is this; that those which are bred in one kind of tree or fruit, if they be transferrd to another kind, they will not live yet men affirm that Cerastes is bred in the Olive-tree, and will breed in the Fig-tree; wherefore the Fig-tree hath its Worms, and feeds forth those also that it receives from other trees: yet they are all like to Cerastes, and they make a small thrall ground. Symposiai faith he hath two horns on his head: when he hath ere the place so hollow that he can well turn himself; he begets another little creature, and changeth one kind into another as Catterpillers do.
call it 'pipewr Butler; it may be because it will eat with its nib into the thickest Wine-cask.

And certainly if there were not something of God in it, and of divine virtue, how could we find to great force in so little and almost no body? Also in the leaves of the Beech, little knots are found wherein the c are small Worms. The fruits of trees (as Theophrastus faith) are sometimes worm-eaten, when they are yet green, as we see in Services, Medlars, Pears and Apples. The Olive both in the skin and kernel hath Worms called eupus, and it is a mischief not to be neglected (faith Theophrastus) for it will not only wheal all the oil and the juice, but will eat up the bones that are so hard wherein the kernel is. Also little Worms are found in Gall that are eaten through, and they are bred in the very inmost pith, out of which afterwards ariseth a kind of Fries and Gnats, as Valerandus Duver in Apotheosis of Lions teUeth. Moreover, in Oak Acorns, and spongy Apples, sometimes Worms breed, and Astrologers preface that year to be likely to produce a great famine and death. I need not contend that there are Worms in small Nuts for all men know it: especially when the Summer is moist, and the wind blows from the South. It is strange that Ringleberghus writes, libe experiment, that these Worms may be fed to be as big as a Serpent, with sheep's milk, yet Cardanus confirms the same, and shewes the way to feed them, Lib. deer, varietas. There are little Worms bred in dry Figs like those in Hazel-nuts, with a black head, and the rest of the body is a whitish yellow, but they are smaller, Belonius faith he found that Cedar as well as Pine Apples were subject to Worms. They are for thickne's like to the female Glow-worm, a fingers breadth long, with a head like an Emmet, but more compact, with twelve incizens; on each side it hath three feet near to the head, and two circular forccvs, ds, with a thick belly, and a sharp tail. Also in the hard and woody hulls of the Witch-tree, there is a broad seed, and oft-times eaten with Worms: and you shall finde there oft-times their very Aureli's. Lathly no fruit can be named, but some Moth or Worm will infect it; even Manna it self sometimes (which the Poets feign to be the meat of the gods, the Scriptures maintain to be the meat of the sons of God) commite and bred Worms, when contrary to God's Word it was laid up till morning.

CHAP. XX.

Of Worms of Fruits, Pule, Corn, Vines, Herbs.

Upon the lower Willow (especially when dwelling galls break forth) sometimes there are found like to rotes, that are full of Worms, as it also happens in the leaves of the Mistick-tree. Zinnzaranis faith there are two kinds of scarlet Oak, one like a great tree; the other a small shrub, about a foot and half high; it spreads very broad, and the leaves are smooth and shining, with a numerous thorny beard in the circumference rising up with many scipes like to the Rose-bush. Our Countrymen call it a Beech-tree, though it be nothing like to a Beech-tree. It grows on plain ground, but that stands high, with little dry hillocks, and unfruitful: when the flubs are bedewed with showes in the midst of the Spring, the Cochineal begins thus: When the lower stalk divides into two branches, and in the middle of these there comes forth a thing that is round, and of the colour and bigness of a Pea; they call this the Mother, because from this the other grains proceed. Besides every one of these flubs hath commonly five Mothers, which at the beginning of Summer and in hot weather put forth a great company of little Worms; and they cleave in the top. A new offspring shoots grows up severally on high of a white colour, that produce living creatures. But wheresoever they meet with the hollow places of the twig budding where the Worms are, they fall down, and become as great as Mister-feed. Then growing up more freely, the white colour changeh into all-colour, and then they appear no more living creatures, but again like unto Pease. Then those grains being ripe gathered, now great with colour'd Worms, which are carried to the Merchants, the thin skin that goes among them breaks. The price of a pound of these Worms that are come forth of the skin is a gold noble; but that part which is yet in the skin, is sold for a fourth part of it; the mean while the little Worms are as if they were dead, and move not. But when the season of the year comes, they are stylized by putting them in linen cloths, and exposing them to the Sun. Then but feeling the heat, they presently creep forth, and strive to fly away; but by the keeper of them, who watcheth them continually, they are hatch'd back into the middle of the linen cloth till they die; while this is doing, and for three days after, there is so sweet a smell and delicious, that no Civet, Musk, or Ambre-greece, nor yet Lemon flowers can surpass it. But if any grains escape from him that gathers them, they pretend forth a numerous army of winged creatures into the air. It was observed one year, that in a thorny field in the Country by Ales the profit of this increase was reckoned at 1000 crowns. So writes Zinnzaranus. And Cardus Clifumi l sthathat in his time, the same fashion of gathering Cochineal was observ'd about Navarre in France, and also in Spain. For they have plots of ground in the open air provided for the purpose, with the fides something high, and they lay a linen cloth upon them and pour forth the Cochineal upon that; the keepers stand ready about it with little wands continually when the Sun shines very hot, and they strike
strike the outsides of the linen cloth, that they may drive back into the middle of the cloth these little Worms that happen to come forth. But *Perum Bellowius* *l. i. observ. c. 17* tells us of another manner of preparing Cochinale.

There is (faith he) in Crete a great increas of Cochinale: shepherds and boys do gather it. They finde it in *fmut* upon a small shrub, of a kinde of holm that bears Acorns flicking to the stock of that shrub, without any stalks and the colour is ash-colour with white; but because the leaves of that shrub are without prickles like to Holly, the Shepherds have a flatte in their left hand to press down the boughs, and holde them so; and in their right hand they haue a pruning knife, wherewit the cut off the small boughs, from which they pull off little round bladders as great as small peas, on that fide they grew to the wood they are chapt and open full of little red creatures smaller than nits, that fly forth at that cleft, and leave the bladder empty. The boys when they have gathered their Cochinale, bring it to the Treater; and he gives them victuals for it. He parts these little creatures from the bladders with a sieue, and then he takes them gently with the tops of his fingers, and makes bals of them as great as Hens eggs: for should he press them too hard, they would run to juice, and the colour be lost; wherefore there are two kinde of dying fluyce, one of the pulpe, another of the bladders; and because the pulpe is more usefull for dying, the price of that is four times beyond the price of the bladders. *Gfuer* also saw small Worms of a yellow and red, upon the uppermost boughs of the Juniper-tree; in the spounge of the Eglantine or wild Rose, white worms breed, from which *Artifex* faith that Cantharies do come. *Gfuer* faith, that after two moneths the spounge being kept in a flove will send forth a great number of little live Worms. Also the Thorn and the Bramble, the Rose, Heath, Broom, tree Trifol, RAFpisa, the Myrtle-tree, Capers, Bulls, the Goosberry-bush, the Palm-tree, the white Thorn, the Privet, Park-leaves, Litoric, and indeed every shrub, and under-shrub is eaten by Worms: nor could *Palma Chrfthi* (which afforded shadow to *Johannis* divine Prophet, when he was very hot) escape this plague, as we finde it written. Also Pulie, the gults of Ceres are (to use the Philosophers word) most Worm-eaten, but how that comes to pass is most uncertain: whether it is as *Theophras tus* seems to say, when the juice cannot be diffused, by reason of the great heat, and the foulness of them? or should we rather say, that at the dry part denies the humour, but the humour flies from it as its contrary? So we see drops hanging on a dry wall: or whether the over great heat corrupts both the natural heat and moisture contained within? That corruption comes this way, most likely *Ethiopia* can refilte. A little worm eats Beams, *Theophrastus* calls it *Mico*, *Hypochsi*, *Aegopis*, it is found breathing in Pulles, but chiefly in Peafe, and hath its name from eating: and such a breed of which *Pelos* after that the falsnes of it is washed away with swows, as besides the Scholast upon *Hepha. Pheartum*, and *Theophrastus* determine. They often breed in the sweeter Pulie, both by reason of the fitness of the nourishment, and the nature of the air fit to breed worms, and when they are bred they nourish them, and raise them forth. Worms bred in corn are generally called *Lanaurois*, which feed on the roots, stalks, reeds, and prickles of winter Wheat, Panick, Oats, Rice, Miller, Rie; others there are that feed upon Wheat-flour, as those that are called *Farinaris*; others of that which is whole Wheat, not yet ground in a mill, as Weevils. The English call the *Farinaris* *Meal-worms*: they are like to ships worms, they have six feet, with a little shining red head, a roundbody, and divers coloured as the meal is: so the belt and white meal breed them white, the elder meal breeds them yellow, the lean meal full of bran hath dark colour'd. Cardan calls them *Meal-moths*, (but as it falls out frequently) not well considering of it. Those that are fed with bran, it is wonderful how great they will grow, and from ten in a fliote time you shall finde three hundred. They are found amongst woollen weavers at all times alomost; for they make a mixture of Bran, Vinegar, and Hogs greese, from whence they breed abundance ly. The Weevil is the bane of wholeWheat, be it raw or torched (as in *fign* of *Actus*, which the English call *Mauls*, the mother of Ale.) For to my Comedian hath its, though *Virgil* and *Varro* call it *Gargulus* or *Gargula*. The English call the Wheat-worm *Kis*, *Pce*, *Bone*, *Weevil*, and *Whirl*, as if you should say double Bull; yet it is indeed a living creature with three backs. It destroyes wheat chiefly, yet it will destroy any other grain, leaving nothing but the hull, and the thin skin. For as *Virgil* hath it in his *Georgicks*:

*The Weevil spoils amisyng heap of corn.*

It is formed like a small Beetle, it hath a beck proper to it self, and with three forks: Some of them are with black bodies, others with brown, but others that are the greater are greenly, and the midle of their body very small. This creature is so dry, that with the leath touch it will turn to dust. It is bred chiefly in the Spring, some few dutes before that Bees swarm, *Theophras tus* faith they breed of one part of the grain, and the other part they feed on. Our Countrymen finde by experience that this wheat-worm will lay eggs in chinks of wals, and under the tyles, and from thence by procession comes a new off-spring. They speak of three wonders concerning these little creatures. First, that though they be but few at first, yet in a short time they will increase infinitely. Secondly, that they will lie between the tyles and in chinks of wals without any meat at least three years. Thirdly, that if they be put into water three dutes with
with Wheat or Barly, when they are taken forth they will live again. Our Countryman Sichardus (a diligent observer of Nature) describes the propagation of Weevilis thus: when Ants have eaten off the top of the ear of wheat, the Weevil goes up, and in that little hole he lyes one or two eggs (but seldom three) so great as a grain of Millet, long and yellow, full of liquid yellow matter; from this afterwards proceeded another Weevil. This little Insect hath both sexes, for they copulate before they do this milchiet. Petrus Comfor affirms that they proceed from Beans corrupted, to whom no man but Guillermins de Conchis attests, lest they should falsely confound a Weevil with Midas, or Bean-worm. Beside this Weevil commonly known, Jacob Camerarius found two others to Pinnus out of the barns of Germany, with a far greater belly; one of them was a kind of afe-colour, and the other green. Alfo Scaliger thout there is in whea worm without a beck, which perhaps Pliny meant by his com-beetle. To this I will refer a certain little creature that is frequent in barns, that creeps with fix feet; and with two short fail-yards it moves its way, it is spotted on the middle of its back and fides, and the rest of the body is black, which I therefore call the spotted Weevil. This creature doth no great harm to corn, because it is still alone: and seldom two of them are found in one barn. About Lanteburg, a Town of Germany, a certain insect is found in the fields, which some call Ulpus, some Korn-worm, others Kornetle. It is said to be very venomous and hurtful, the Husbandman will leave their plow when they meet it, and run after it to kill it. It is black from a little red, dwelling amongst wheat and eating up the corn; worms bred in Vines, the skarlet Oak worms are like them, such as Brefuaculos doth strongly maintain and think that they are bred on the roots of Pimpenel. Amongst herbs, both for phynick, and for meat, the Violer, Radifh, Rue, Bafil, and many more are molested with worms. The worms in Violets are very small and black, and run very fast, as Jacob Gareus a moft diligent Apothecary, and very famous in the knowledge of simples as there are not many, affirms out of the root of the Haffichoak a worm comes, that hath fix feet, like to a Caper-pilles, and whitish, with a reddish black head; where it bites the roots of Haffichoaks it makes them black, and at last kills them. The Radifh produceth the like. Cardan (as I remember) report that there is a worm found in the leaves of Rue and it will grow wonde-ful great, as the Hazel-worm will do if it be fed with heeps milk. A little worm that is the child of the dew, and a greeft in bail with a body almost upright, he sticks fast by his hinder feet, while he takes hold with his forefeet. Sugar is made of the Sugar cane, the sweeteft of all Sults and the commonest of Physicians supposeth, it is altogether free from corruption. Yet under the authority of Scaliger, I affert that a little worm is bred in Sugar, long, black as a fleth, and (if you take away his Beck) like to a Weevil; and therefore we may truly call it a Sugar-worm. Belusius also makes mention of this. But that Insect which the Germans call Mayen wormen, Seems to breed very seldom, faith Camerarius. For in the moneth of May dewes often fall that are very unhealthful and if they fall upon the leaves of Hops, they turn to little living creatures called Hopen. Amongst thousands of these you shall sometimes see one far greater than the rest (though it is scarce greater than a fat bowling) it hath yellow circles about the belly, the back is chaffer'd, the tail is somewhat long, the colour of the body for the greatest part is blackefh. This when it wants aliment from dew, devours one by one all of his own kind, even beginning with that is next to him: he changeth his skin like to Silk-wormes; lastly, when he is almost transparent, he putting off his left skin, he hangs by his head and feet by a kinde of thin thread, like to leaves, and so he dies; may we not call this worm the Hop-worm? In the talk of the Aliphodil, a worm is bred of a clear colour when the herb begins to flower, out of his shoulders wings grow by degrees, and when he can fly, he forsoth his habitation. In the twain joynes of the codd Arfimans and the wilde Thifhte, little white worms breed, as yellow ones do in the purple flowers of the bathard wilde Chervil, and red ones in the root of Pimpenel. I often have seen in the female Smillage downie worms; in Mullrums and Colewors, small black worms; in the root of Acorus, white ones: in the root of Elecampane whileft it is green and growing, white worms breed in ten or eleven joynes that are visible, that are as thick as a Gooquil, with a lit-black head, and six floft feet, and the body all black. The Kings of the Indians, as Cefarens tellfeath, use to eat for their second course, a worm found in a certain plant, when it is rolled at the fire, and they commend it for the daintife and sweetefl meet. In the head or talk of the Fullers Teafil, we have seen a worm very small, with a little head, and fix black feet, with ten or eleven incisions. First it eats up the fpongie fath of the talk, and when that fails it dies for want of food. It is easily found at the beginning of October, though Marcellus upon Diocondres doth most shamefully deny it. If I am not deceived, this is that worm the Ancients call Tavism. Xerocrates calls a plant like a double Camomele Calechedon, (faith Pliny) it hath a falk like Fennel Gigne, with a tall and prickly head, and like to an egg in form: in this with age they lay little worms breed, that are good against the tooth-ach. In the roots of white Thistle (which plant is luxuriant in the high mountains of Savoy) there is a little worm found, breeding in some, in others it grows great, and in most of them it grows to have wings and ready to fly; it is white, and hath some joynes that it is divided by, and very black shining eyes. It may be there is great use in physick of a little worm bred in wilde Tanfye; but I leave the enquirie of that to those that are curious in the secrets of Nature.
Concerning the use of Worms that breed in Minerals and Vegetables, and the way to destroy them.

Some think that worms that are bred in stones, (whereof we speak) tho' I mean that are as great as Hand-worms, beaten into powder with the stones, are good to cure Ulcers. Also Marcelius winnelith that these bruitled and given with three Cyathii of water, will break and drive forth the Stone by urine. The Ancients used the more solid wood that the Thripus had carved with their teeth for Seals, and Antiquity ascertained the invention of that to Hercules. In old trees red worms breed, whereof Serina writes thus.

From an old tree doth red worms procure, 
Brute them with Oyl, and drop in worms, be sure, 
For pains of 'th' ears this is the safest cure.

Galen out of Apollinia subscribes this remedy. Worms that breed in hollow and rotten trees heal secret Ulcers and all symptoms of Ulcers, and diseases of the head; also being burnt and powdered with their weight of dry Dill, they cure Cankers. Marcelius. But Aurelius adds three Worms bed of wood to an Ointment against the Elephantiasis, which he learned of a certain Phisitian that took his oath of secrecy. The rootenmeat that is made by their biting dries without pain, and is profitable for many things. Galen Expr. 3 c. 7. commends this kind of powder, against knobs, clits, and sores of the Fundament. Take Orpiment in pieces three ounces, rotten wood of an Oak four ounces, make a fine powder, then foment the place affected first with the warm urine of a young boy and afterwards fire on this powder. But the Coffe are not only food for the Inhabitants of Pontus and Phrygia, and they delight much in them (as Worms in Cheele are to the Germans) but they also cure Ulcers, increase milk, and as Pliny saith, when they are burnt to ashes they cure creeping sores. The Worm in Fullers Teazil put into a hollow tooth, will give wonderfull ease, Pliny. And if it be hanged in a bladder about the neck and arms, it will cure Quartane Agues, Discoevides. One Samuel Quickebergins a learned young man, in an Epistle he writ to D. Gifuer, hath these words; Sith he, as I was gathering of Simples, a certain old man came unto me whilst I sought for a little Worm in the head of the Fulles Teazil, and he said unto me, O thou happy young man, if thou didst but certainly know the secret virtues of that little Worm, which are many and great, And when I intreated him, that he would acquaint me with them, he held his peace, and by no intreaty could I obtain it of him. Pliny afferts that the Colewort Categorillas being but touched with it will fall and die. The Worms of Caledracon (which plant some men confound with Fullers Teazil) being put into a box, and bound with bread to the arm that fide the tooth akes, will wonderfully remove the pain, faith Xenocrates. The Worms of the Eglantine will cause sleep, and therefore some Germans call them Schlafers: They are applied alive to a Pilon (but always their number must be odd) and they do certainly cure it fide quickelbergins. A little Worm found in the heb Cardiacis, bound up in a piece of Skirtlet and hang'd about the neck, will cure the tooth-ache. Marcelius. The Worms that are found in the root of Pimprenel, make a most incomparable purple colour, (Gifuer) that I wonder the Ancients said nothing of them. All little Worms found in prickly herbs, if any meat stick in the narrow passagial of the throat of children, will presently help them. Pliny. Rub a faulty tooth with the Worms in Coleworts, and it will in a few days fall forth itself. Meal-worms are good and seem to be bred to catch black-heads, and Nightingales, and to feed them; but it is there in winter wholefome; meat for them; for they purge, heat, and nourish also, those Birds that have but a thin nutriment to preserve them. I spake before of the profitableneffe of the Cock-whel Worms. Brassavola affirms the fame of Vine-wormes, but how rightly let others judge; but they are not only good for dyes but necessary in Phylick, for they both binde and dry, and scour without biting, and incarnate also, they cure rheumatick eyes, mingled with Pigeons blood, they help suffusions of the eyes, they cure Dystremes, they help hard labour in Childbirth, and debility, they cure Melancholy, fea Epilepsies, they provoke urine and the terms, they heal the Mixis, they dissolve water and cholers, they abate the putting of the heart, and upon that cause they are put into Confection of Alkermes, and are the Bafis thereof. Diffor. Avicen, Kirander. I say nothing, how greedily Sparrows,Wood-peckers,Hens, Wood-cocks, Snipes, the Parrot, a Black-bird, Larks, Caracippers, Reed-parrows, and many other birds, that are good phylick, or else meat for us, do feed on the Worms of trees and hebs. Now since God hath mingled conveniences and inconveniences together, both to come up our providential puissance, and to punish us with punishments due to our sins, howboth of these may be prevented I shall shew briefly, phoenix being charfified under the shadow of the Gourd, he thought it safe and happy to be so, when the heat was so vehement, But God sent
a worm and took that from him, both to try his patience, and demonstrate his frailty. There was an Arch-bishop of York, whose surname was Grey, as our Histories relate, when he had abundance of all Corn in the time of great scarcity, yet he refused to let the poor have victuals either for money or instesty. A little after this his barns that were full of Corn, were to exhaust with Weevils, that they left not one whole grain of Wheat or Barley: even as St. Jerome said, Heto that boards up his Corn the people shall curse him, but blessing shall be on the head of him that felleth it. So God, that he may call forth a sluggiard father of a family, sends the Moths and Worms into his Orchards and fields, both to make him laborious by this means, and also to teach him to make use of such helps and means that God offers to him. Our Antecedors have delivered by tradition many of these: But because Cato, Vitruvius, Pliny, Palladius, Theophrastus, Columella, Varro, Virgil, and many of those that were Princes in husbandry, have abundantly set down these things, we shall only give you a smack of them here, because others have given a full draught. That trees may not be eaten with worms, plant them in the new of the Moon, and cut them down between the new and old Moon in the conjunction. Also anoint them with Tar, and often wet them with the lees of Oyl. Also keep them under Covers, every where, that they may not stand exposed either to great heat of the sun or tempests of weather. Also that trees may not grow worm-eaten, anoint their roots before the first planting of them, and then afterwards moisten their roots with mans urine and a third part of the strongest vinegar. Some sleep a long while Squills with Lupins, and they sprinkle the places that are worm-eaten or pefle out their liquor with a Sponge, or they flme the flock of the tree till it be very warm, and they pour into the holes Bitumen mingled with Oyl. Others sprinkle on quick-lique, others Oyl-lees and old piffe, others Hogs or Dogs dog-feet in Afles pits, the roots being first uncovered. Democritus taught men to buile Terra Lomnna with waters, (it may be he meant Carpenter's red) and to flame them with that. Some pick out the Worm with a brasse pin and put Cow-dung over the hole. Red hairy Worms search to the inward paths, if you can draw these forth and not break them, and burn them hard by, it is reported that all the rest will dye with it. It is good also to pour often upon the roots, Buliffs gall, and lees of Oyl: To plant Squills, rue, Worm-wood hard by, to make a meniothious woman pafle over the place often, to flame the pruning knives with Oyl of Cantharides, and to avoid lean and dry ground. By these remedies Oranges, Peaches, Pomegranates, Queens, Pears, Apples, Olives, and Olxes, and other trees are kept found a long time, and almost free from Worms. Affes laid to fight-tees, drive away Worms, for it hath the force of falt, though not to strong. The seeds of Flag-tees or kernels will not be eaten by Worms, if a slip of the Maffick tree or Turpentine tree be sitt by them. As for Vines, Aristides tells us to sprinkle Sea-cole with waters, and cast upon the place in the Spring-time, and then to flame the roots of the Vines that begin to bud. For if you flame the pruning knife with Goats blood or Frogs blood, or do but anoint the W heter-pee with its worms will not breed there. Africans faith that the tears of the Vine mingled with the ashes of the Vine-flaks, and put on the root of Wine, it will do as much. Lastly they are killed with a fume of Ox-e-dung, Harts-horn, Goats-clawes, Lilly-roes, blutions of Ivory, women hair. The herb Pionie or Thorow-wax, planted where Vines grow, drive away worms. Some there are that Boyl Affa fatus and Laserwort in Oyl, and anoint the focks of Vines with it (beginning at the root) and with Garlic bruiled. The seeds that must be fowed, should be kept in a Toottofe-thells or Mints to be fowed amongst Pot-herbs, but chiefly Tares. The bruiled leaves of the Cypress-tree mingled with them, will avail much. Aggregation. And Palladius faith that all feds will be free from Worms, if a little before you fow them you foke them in the juice of wilde Cucumbers. Pliny bids to prepare feds of Lupins before you fow them, in the smoke or some hot place, because in a moyyit place the worms will eat up the middle of it, and make it barren. Varro faith that worms will never touch Onions that are set with salt and Vinegar. Moreover, the feds of all pot-herbs wet with the juice of Houleek, will admit of no worms. Against Weevils, that are a certain plague to Corn, it is good to dawb the walls with lime and hair both within and without. Others do for two days steep the fruit and leaves of wilde Cucumbers in lime water, and with fand they mould it up like failer, and with that they failer the inides of their Granaries; though Pliny writes that Quick-lique is a very great enemy to Corn. Some put bealls pife to the fume, some worm-wood, juice of great Houleek, and hogs, others pour on the ground Oyl-lees, Herring pickle, and the decoction of Flea-bane. Strabo mingles Marle. Others report that often fanning of wheen keeps it safe from weevils; but Columella denies this to be true. Caio Lib. de Re Rustica commends Clay mingled with Oyl-lees, and he would have the Granary to be fanned with that; Varro with it almost the very fame wyes, but he commends Clay with Oyl-lees, Maple tree and Corn mingled together. Our English men do deceive and destroy them divers wyes. Some in the middle of the heap of Corn do place brasse Veiftis half full of hot water, that the Corn may lie almost up to the mouth bims of the Veiftis; for thus they think the weevils are taken or destroyed. Some shut up an Ant-hill and Ants together in a bag and after that they pour it forth in a corner of the granary: thus in ten dayes will the Ants destroy all the Weevils, and when they are killed, they take them and carry them forth, that are going back to their former house. Also they use to put into that place young Chickens that will soonest

The Theatekr of Insefts: or,  Book I1.

1090

Of the six footed Worms of living Creatures, and first of Lice in men.

Since God hath given the principality to man amongst living Creatures, we will begin with him. In the first beginning while he was in his innocency, and free from wickedness, he was subject to no corruption and filth, but when he was seduced by the wickedness of that great and cunning deceiver, and proudly affected to know as much as God knew, God humbled him with divers diseases, and divers sorts of Worms, with Lice, Hand-worms, Belly-worms, others call Termites, small Nits, and Acaries: *Acatus Alemans, Phthirickers, Pharaoh King of Egypt, Caffander son of Antipater, Democrates, Calathenes, Olymphis, Scylla the Dictator, and that river of Eloquence Herod, knew it to be true that I write, who perishing with a Lowry disease, used Physicks and Baths in vain, for they died miserably of them. Some also write that Plato (being elevated perhaps more then he ought, and so wise that he disdained others) died of this disease; whence grew the Proverbs, *Plato Lice. I shall say nothing of Henry the second a most cruel Tyrant, and Theodorus that propagated *Arianjus, two Kings of the Vandals: I let pale *Arnolphus an Emperor, and an emmanciate *Sudomites, and Cesar Maximus a filthy Pander, all confounded with Lice, who found that when God commands, the leaf and most contemptible Creature hath force enough to destroy furners, and with Pharaoh they were compelled to acknowledge this to be the finger of God.

The Hebrews call a Lowie *Kifim, and Chinamn, the Greeks *φίλος, *βιοσολα, *βιον, *βιονια, *βιονιας, *βιονιας, the Italians *Piscadiee the Spaniards Pies, the French Pies, the Germans *Lafe, the English Lows. The Latins call it *Pet, as we read in *Plantas in *Carum, wherefore you are a kind of Liois, and *Flies, *Grats, Lice and Flies you trouble all men, and are carried by all, but none do any good. And Livy to *Gladiatus, *Are they Flies, Wood-lives, or Lice? *Answer me. And Lucilius when he sees me, he scratches his head, and picks Lice, *Fusius. Where still a Lowie is called *Pet. It is a beaftly Creature, and known better in *Iimes and *Armies then it is wellcome. The profit it bringeth, *Achilles *Sheweth, *Iliad 1. in these words: *I make no more of him then I doe of a *Lowke; as we have an English Proverb of a poor man, *He is not worth a *Lowke. The Lice that trouble men are either tame or wilde ones, those the English call *Lice, and their *Crab-lies; the North English call them *Perit-lies, that is a petulant Lowie, comprehending both kinds, it is a certain sign of misery, and is sometime the inevitable scourge of God. The same ones that breed of corrupt blood, are lefe, and reddish, from *Fleames white, from melancholy and adulter humour, black, and from mix humours they are of divers colours, as *Petrus Gregorius noted l. 33. If you rub them gently between your fingers you shall see them four-square, and something harder than Fleas, whence in the dark when you take them you may easily finde the difference. They that breed in the head are bigger, longer, blacker and fiviter, those that breed in the body are fatter, bigger bellies, flower, darkish white, and marked with blackish streaks. Some confantly afferm, that in May they have een Lice with wings, and that the Locut-eaters, of *Lybia, when they have fed too plentifully of them, after they come to be forty years old, will die with these Lice, as Diodorus *Siculus faith confidently, 4. *Antiquitiae. *Agatharides speaks of these Lice, but he faith they are like to Ticks. They chiefly fatten on the chin, eye-browes, and the privities full of hair, the groin, and the arm-pits, their body is more compact, their nib is sharper, they bite more, and tickle leffe. For Tykes will sometime enter deep into the skin with their nofe, that you can hardly pull them out but with the loffe of their heads, and they fellomede aches but they bite cruelly, and make themselves a hollow place, and there they stand fast. Some call these Lice in *Latines, *Cicci, some mens Tykes, others Vultures lice: *Ariflate calls them wilde Lice, *Pisf. *Animal l. 5. c. 31. it is harder then a tame Lowie, and is more hardly removed from the place it bites. Our French men, faith *Joubertis, call them *Mopbones, and *Fattes the Germans call them *Fente. *lenjs, *Gordiones *Pessolates: They tick very fast to the skin, or bite through the * CONTENTs; they are of a dryer matter, and that which is halfrotted, 

Chap. XXII.
to they are not to grow, but they are more compact. The Arabian call them Alcarad, Guardarn, Faith, and with an Article, Algardarn, and Alford as Ingraffias observed. Also in the Synonymes contr. Rhoff, they are called Metes and Immores. The Italians call these Plantas and Chacilla, and Alhoniac Plantas. All Lice breed from humours, flesh, fat, sweat or corrupt, and differ exceedingly in respect of the place and humour. For those that breed of mans blood will die if you smear them with the blood of other Creatures. Also they that breed in a mans head will hardly live, or not long in his body. So the white Lice bred in the privies will die in the head. Those that breed of flesh putrefied, such as oven will abound in Ulcers ill cured, will not be fed with the excrements of the skin. (faith Hieron. Mercurialis. l. c. 7. de morb. c.) The opinions of Authors are divers concerning the generation of this disease: Aristotele 5. hist. anim. c. 31. thinks that Lice breed of flesh corrupted, in place he affirms those three things. First, that they that breed Lice have some pulses arising before in their skin, which if a man prick, the Lice will appear. Then that this disease come not, but by mort humour, or to such that have been troubled with a long and morty disease. Lastly, that all Birds, Fish, Four-footed beasts, are molleted with this disease, except an Alle. The first opinion pleasteth me not: First because in the skin of the head Lice breed most commonly, where there is the least portion of flesh. And again, if they should breed only of corrupt flesh, the heads of young children that are almost alwayes full of them would be to wanting of flesh, that it would almost wait all away. Further, in Consumptions, where the body nourisheth not, and is wholly consumed almost, they abound most commonly, where all the flesh is so dry, that there is no mortyler almost to breed Lice. Theophrastus is of another minde from Aristotele, affirming that Lice breed of corrupt putrefied blood; which Hieron. Mercurialis in the quoted place labours to infringe by these reasons. First because in Feavers that grow from putrefaction of blood, there is seen no such increase of Lice. Secondly, if they should be made from blood, some of them at least would be of a red sanguine colour, and reticfe from whence they were bred, as other things doe, but we see no such therefore, &c. In which place this otherwise very learned man, seem to beg his principle. For in the heads of our children we oft times finde very red Lice, and in those that are upon recovery of a putrid Synochus, we finde that oft times many red and mingled coloured Lice breed. Galen. 1. de comp. med. sec. loc. c. 7. and Avicenna, l. 4. fen. 7. trad. 5. c. 26. atribute them to some other caufe, and as Mercurialis thinks, that their opinion is the truth of all, namely, that they breed from the hot excrements of the second and third concoction putrefied, nor sharp nor bad. To understand rightly their opinion, we must know, that when blood is changed into the substance of the Limbs, many kinds of excrements are produced, whereof some are dissolved by infensible transpiration, others by sweat, others turn to filth, others stay in the skin; Those that are retained in the upper skin, make dandruf, if they stay in the depth of the skin, or are bad and sharp, they can be no heads. But since I have observed that in some that were in a Consumption incurable, where the humps of the humour eat up the very roots of the hairs, Lice come forth abundantly, why may I not think by their example that they may breed at first from sharp humours? Sediger would prove that Lice breed not from putrid humours, because hæms grow from the seed without putrefaction: for he thinks the principle is altered, but he believes not it can be corrupted. But by his leave I must say that Sediger or the Apostle must be mistaken: For in St. Pauls 1 Cor. 15. That which now is not quickened shall not be live. But if death be a corruption, as the Philosophers say, then Sediger was deceived, and (yet keeping the Laws of friendship) we may defervedly reject his opinion. And Epithymum breeds from Thyme, and Miseltooar thorn from some trees, that are found, and not yet corrupted. But I answer, that a Lowe differs more from the principle it proceeds from, than Epithymum doth from Thyme, trees from Miseltoo. For these are of the same kinds, and as it were thrue forth from the abundance of fruitfull matters, and Miseltoo is nourished from the pit of the tree. But it is apparent, that Lice seldome breed in found bodies, or not at all, but those that are cachetical, in Consumptions; and full of putrefaction, and watry blood, and whose flesh and skin are corrupt as well as their blood, and are troubled with them. Oft times found men sweats, and yet breed no Lice, for they will not breed of all sweat, but from corrupt sweat, and that which is not bitter. But when it grows bitter, (as we finde it in those that are dying, or troubled with the Jaundies) they forake their stations and creep from the body into the pillows that are under them; yet they do not always go to other places when men are dead, for as those that take care of the dead Corpse affirms, they will still stick about the mouth of the houcm, and under the chin by the sharp artery; which places which are most full of native heat, when they once creep into; it is no small sign of death approaching. Also the complexion serves much to breed Lice, the Countrey, and the dwellers. For some have more, some fewer, and some in any Climate will be free from them. Opuestos Navig. c. 82. writes, that Christians in the West-Indies have not so much as a Lowe in their heads, and yet the Inhabitants (to the Plantas his pirate) are very Lowly, people. Also our Country-men have ob- served, that have pullen upon the Indians teas, when they have left the Isle of Azores b. hinder them, all the Lice presently die, and when they fee those Islands again, they will revive abundantly. I think the reason is, (that I may herehelp Pemius in) the extreme heat between the Tropicks, that not only killed alienem from them, but the Element also. Vespucius reflieth of the Ile of
of St. Thomas, that the Blackmoors there are full of Lice, but the white men are free of that evil. As for drenching the body: all Ireland is noted for this, that it swarms almost with Lice. But that this proceeds from the badliness of the people, and want of cleanly women to wash them is manly, because the English that are more careful to dress themselves, changing & washing their shirts often, having inhabited so long in Ireland, have escaped that plague. Hence it is that Armés and Prions are so full of Lice, the sweat being corrupted by wearing always the same clothes, and from thence a festeth matter for their original by the mediation of heat. So that these keep no dews, but delight in eating, and filthiness, and feed on Vipers, Radiastes, Bats, Figis, Lignum Albus, Garden Smallagis, and Dates too much, their bodies will with putrefaction of humours breed Lice between their skin, as Dioscorus in Empirics, Simon Sethos, Aetius, and Pliny affirm. But Dioscorides faith it is exceeding false, that Lice will grow from eating Vipers. Sheeps-wool that a Wolfhach killed will breed Lice, if a garment made thereof be wet with sweat, which grant that it be an invention of Arifate & Pliny, yet experience teacheth us, that clothes smeared with Horse's grease, will breed Lice presently. Alcan faith that he will be full of Lice, who is anointed with oil wherein a Stellio is drowned.

Against this terrible disease, which the Greeks call θυάπερα, many have invented divers remedies. The Irish and Ieland people (who are frequently troubled with Lice, and such as will fly, as they say, in Summer) anoint their shirts with Saffron, and to very good purpose, to drive away the Lice, but after six months they wash their shirts again putting fresh Saffron into the Lye, but Αντιγονας in Συγν. Ηφθ. Paradox, so soon as little pushes or wheels appear upon the body, bids us pick them, and take forth the Lice: but if they be left unprick, that general lowtie difcase will come, whereby they say that Αλκανοος Φυσικος, and Περιπετεία Συρμες were destroyed.

The general Cure of the lowtie Diseafe.

Amatus Linfivrides cured that good Venetian at Acania (of whom I spake before) who was sick of a general lowtie disease. Fifth, by opening a vein, and then purging him; for so he drove forth the corrupt humours that foumented the disease, not at ones, but twice or thrice. Afterwards by applying Topical remedies, in a short time he grew free of this plague. Topical Medicaments were made thus: Take bitter Lupins ii. pugs, seeds of Staves-acre ii, pugs, in the sharpest Vinegar what is sufficient, boil them, and with that Vinegar wash the body from head to foot, then wipe and dry it, and anoint it with this ointment following: Take Staves-acre two parts, Sundaracha of the Greeks one part, the feet Nitre half a part, mingle them all with the sharpest Vinegar and oyl of Radishes, and pour them together very exactly, and with these make an oyment: with which Amatus soon attained his purpose, that the feck fell no more into the same foul diseafe. Amatus Lyfivrides, cent. 3, curat. 58. Hecur. (as ιοσθοφος and Αγιοθοφος teteiture) when he had got this disease by his great pride, and he was somitter from God, he went to the Baths beyond Jordan, and the Bituminous Lake, that were very good to cure this diseafe, but at that time they were of no force, when God was pleased to punish a proud Prince with a contemptible creature. If the body be lowtie all over, it swes a general Cacochymia, wherefore it is best in my opinion, first to open a vein, and then to give a Purge, as the humour requires, and so to proceed to specificalls, and such as agree with the place affected. Dioscorides prescribes such kinds of internal remedies: Take Garlick with the decoction of Origanum, drank this three dyes. Another, Let the sick drink Coriander bruited with Origanum, and anoint himself outwardly with Honey. He commends also Alum-water, and the Decoction of Bites, juice of Ivy and the gum of it with Honey, liquid Pitch, Alum, Synophex smeared on with Vinegar, Nitre with Samian Earth and Oyl.

Other outward Remedies that kill Lice out of Pliny: Seeds of Staves-acre beaten, without the hulls, will free the body from Lice, but better if you mingle them with the Sundaracha of the Greeks Multiard-feeds, Garlick, with Vinegar and Nitre are good for the same. Oyl of Radifh dode cure the lowtie diseafe contracted for a long time. Siler, Mountain-feed beaten with Oyl: Hylip, mingled with Oyl, Tar, Sweet Gums, the juice of the wilde Vine, and Staves-acre boil'd in Vinegar, will free garments from them. So black Hellebore with Oyl or Milk anointed on is very good. Internal Remedies out of Pliny. A Snakes caft skin powdered and drank for three dyes, will keep the body free from Lice. Multiard-feeds, or seed of Tamarisks, drank are good; so is water of Radifh-leaves, and the juice of Privet-berries, Plantain, Garlick, the juice of wilde Cucumber, and Tar. Novus commends the root of the Sharp Dock, bruited with Oyl and anointed, first wathing the body with the decoction of Lupins, and he prescribes a remedy of Sundaracha of the Greeks, Nitre, and Staves-acre. Orbyphus approves the juice of Pellitory long rubbed on, or Nitre with the wilde Vine in a Bath. Rhaphis prefers the leaves of Bauberies, gym of Iris, great Knot-grafs, and Sea-water, Avicenna commends Quickifler with oyl of Rothes, and wilde Staves-acre with Arlenick. Holy Abba bids us purge the body, and then to eat meet of good joyce, to wash the fifth, and to change our clothes often; then he prescribes Quickifler bruited with Staves-acre-feeds, and oyl of wilde Saffron, and with that to anoint the body morning and evening, after bating. He farther commends to use these Remedies: Take long Birtwhort, built it with Pine-leaves and Quickifler, and with oyl of Lupins what may serve turn, make an Unguent. Anoint the body with that at night, and in the morning wash it with
with hot water, after that, with a decoction of Alum, Wormwood, Summonicum, or Mygwt, rub it away. Another: Take round and long Birthwort, red Artemisia that is the Greeks Sundracha; and with oyl of Ban, make an unguent, with this anoint the body in the evening, and in the morning rub the body with Bran and Barley-meal. Another: Take brier Coltsfoot, Cashtaunam, Bulls gall, bray them with the Oyl of Pitches, anoint the body with it, and in the morning wash it with the water of a decoction of clear Bran, or of Barley. Constatius used Quick-filver with ashes, Litharge, Vinegar and Oyl mingled together for hot complexion; but for cold he used Pine-tree juices, Sea-water, Staves-ace, Nitre, Arsenick, and oyl of Wilde Saffron. Jeannes de Repeiffins mungled Quick-filber with Aqua-vite, and the powder of Wilde Staves-ace, with that there is a ginzile, which worn about the bare loyins will kill the Lice. Serenus, Abinesar, Amates Lusitanus, Matthiolus, Hildegardus, Johan. Vigo, and others, prescribe other remedies, but most of them of these materials. He that defies more remedies against the lowly disease, let him read Pantus Aeginae 1. 2. 3. Galen l. 1. de comp. med. sec. loc. and Galen. de Salubris l. 1. c. 48. I know one (faith Pennins) who when he was Governor of an Hospital, he cured the lowly disease thus: He whipt the fick till the skin came off with Birchin rods, and where the rains were, the Lice would never breed again: A new kind of cure, and most fit for idle Sea-nice and loulfoul companions. Amates Lusitanus (if I do not mistake) tells of a poor man that had a hole in his back by reason of an Ulcer, out of which daily abundance of Lice crept; questionless they were bred between the skin and the flesh, and after wards by an ignif of Wilde Staves-ace; Quick-filber, Pepper, and Lard, he was cured. Ruland prefers the Bal- 

fum of Sulphur to all remedies, and not without cause. Auctius writes, that Wilde Lice must first be picked out with great diligence, then the place must be sooment with warm Sea-water; yet very warily if they flick in the eye-brows, that you hurt not your eyes: then apply this remedy: Take Alum, Sifilij, j. dram. Staves-ace, j. obolus, Pepper j. obolus, hurt Bras j. dram, Myrrhe j. obol. Scifil-stone j. obol. and Nifl. Mift torrefied, j. dram; bruize it and dry it, and to use it: Then let them bathe and heat their head with diffiluents and strengthenes, with the whole body, and rub it again. Our Countrymen pick them out, and then anoint the places well with black Sop, and if the body were too hot, anoint the body with the pap of a sweeter apple mingled with Quick-filber, and it is a certain remedy. Celsus faith they offend the eye-brows so much sometimes, that the eyes being ulcerated they dim the sight, then incorporate purified Quick-filber with tops of Wormwood, and old Hogs grease, for nothing does more certainly cure one, if it be done with caution. Also take Aloe 2. ounces, Centa, Frankincence, each v. ounces, Lard what may suffice, make an ignif; some mingle with this Quick-filber and Brimstone. But here observe, if Crab-lice do breed thick on the beard, eye-brows, the share, and peritonum; first all the hair must be shaven off, so from as a general purgation hath been taken, and then the forementioned: Topicks must be applied, and all galls, especially Bulls-gall, Calis gall, Capons and Partridge, with Juyce of Centabia, and Quick-filber are very good. A lye of the ashes of Tamark destroys the Lice. Rhazes and Albertus command the marrow of a live Vulture taken forth. Varignana with the milk of the greater Bindweed, wide Mints, and Sow-bread, with a lotion of Honey. But chiefly he extols this Medicament: Take Staves-ace 2. ounces, Wine iv. glases, Hogs brills 2. ounces, purged Quick-filber 2. ounce, let them boil, and formen the body with the decoction, Marigold and many others make great reknowning of Wine-lees, Juyce of Stoons, a Lici- 

sium of Soera, Acrons, Calis, Pellitey of Spain. But Gilber the Englishman burns Leeches and Spirax Calamata together; and with these and Hogs blood, he prepar the excellent Un-

guent. 

Thse filthy creatures, and that are hated more than Dogs or Vipers, by our dainty dames. Ufe of Lice, are a joy to those that are fick, and sometimes a cure. For they that have lain long fick of a putrid disease, when Lice breed in their heads, they foresaw the recovery of the fick. For it is a sign of the exhaling of it, and flying forth from the centre to the circumference. Also experience proves that the Jaundies are cured with twelve bruited Lice drank with Wine. Pennins gave Lice and Butter to beggars and such live on alms, very often, and so he recovered some that we almost deprate; some for the Dysurie are wont to put into the yard living Lice the greatest they can, to draw forth the wine by their tickling: which Alexander Benedilus relates of Wig-fice, when clammy humors havinhurt the eyes, some cleanse them with Lice put in them, which creeping here and there like Oculis Chisifis, collect the matter; and wrap it up in that they will fall out. Alfo what shall I say? ApeS, Bbamosons, will feed on them, And Herodias and Strabo in Pontus speaks of men that feed on Lice, (to whom Ariannes in Periplo confers) and the Spaniards speake the fame of the Inhabitants of theProvince of Cuenena in the Indi- 

es. And they hunt after them to greedily and defire them, that the Spaniards can hardly keep their flaves from feeding on them. And it is no wonder that they can feed on Lice, that devour Horses, Aflses, Cats, Worms (and more than that) men that are raw. But because it is an idle work, the workmen have that task upon them to catch Lice, and they do that work almost, and therefore Strabo calls them Pedilegar. Serenus makes another ufe of them, and writes thus:
**The Theater of Insects: or, Book II.**

Some hurtful things our bodies do produce
By nature, which do stand us in great afe,
To keep us waking, and so stop th' abuse
Of sleeping ever much ——

See the Chapter of Nits among the insects without feet: Chap. 35.

**Chap. XXIII.**

Of the Lice of brute Beasts and Plants.

This plague fell not only on Man for his first transgression, but upon beasts also: yet amongst mankind children are more filled of them than young people, men than women; sick people than sound; nay people than such as are cleanly; and so it is with other creatures: only the Ape is said to be free from this disease, nor because Christ rid upon him, (as some fool dream) but because he goes so softly that he seldom sweats, or else God hath bestowed upon him some peculiar antipathy. The Lion is a contagious creature and king of beasts, yet is he so tormented with Lice feeding on his eye-brows, that when he cannot help himself with scratching with his claws, he will sometimes grow furious, as Pliny reports. Who hath not seen the Lice of a Horse, that most generous four-footed creature, and Nits with red heads that are apparent, and the rest of their body is of a dark white? The Lice of Oxen and Calves are black, and those that are lean have very many, like to Hog-lice almost; but fhorter and somewhat thicker. Hog-lice have the same form, but they are so great and hard that you can hardly kill them with your fingers, these are called  gif h from burning, as Albenus testifieth I. 4. c. 205. Dogs though more seldom, yet are sometimes Lowie; but their Lice are small ones, speckled, and with a whitish head, the rest of their body is of a blackish or win colour from blowes, as I first observed by the Dogs at Malta. Sheepes Lice are very small, their heads are red, their bodies white, Goats Lice differ but little from these: when the flag hath throve to cast his horns, he is troubled with an exceeding itching of his eye-lids, from Lice that breed of the same colour with their head that thuffs forth; who doth not know by Géner History of Birds, or by his own experience, that Swans, Hens, Geese, Pigeons, Quails, Pheasants, Partridges, Hawks, and other fowl have Lice? Also Palladins, Columellas Pavana, Varro and other principal Leeches for cattle, have fliowed us remedies sufficient for to kill Lice in brute beasts, that it will be no glory for me to inftirt upon them, nor fruitful to the Reader: what Avicenna L. 4. fem. 6. trad. 5. meant by Vultures Lice, I cannot conjecture, and I much desire the help of some Oedipus to untie this riddle for me; we mentioned before in our first Book, that your dung-Beetles are killed by their own Lice. Also Salmon-filies, especially the leaner fort, were seen by Pliny to have many Lice under their gills oft-times. Also they are found in Plants, as Southernwood, Wormwood, flowers of Water-lilies, and chiefly in Columbine leaves, in June by reason of its exceeding sweetnefs, (faith Géner). Also some plants are called lowie plants, either because they are good against them, as Staves-axe, or because they breed Lice, as Dedanum his Fiftularia, or because they abound with Lice, as Columbines, or from the great delipicableness of them, as the fruit of the great plum-tree, which are therefore called lowie plums.

**Chap. XXIV.**

Of little Lice called Syrones, Acari, and Tineæ, or Hand-worms, or Mites in living Creatures.

The Vitæ finally reports that the Ancients knew not what Syrones were, for Aristotle calls it Aegleum, 5. Hist. Animal. c. 2. Also they seem to be called Syrones, and viíó in vitra, because they creep under the skin continually. It is the smallest living creature that is, which useth to breed in old cheese and wax, and also in men's skin. Pliny and Snider say that æges is such a small thing as is too small to be divided. In Larine they are called Pedicelli; in French Cirons; in Piemont Sciri; in Gallaio, Brigantes; in English Mites, in cheesse, leavesc, dry wood, and wax: but in men they are called wheel-worms: the Germans call them Svezen. Abensuar faith that Syrones are called Assealæs and Assæbæ: they are little Lice creeping between the skin of the hands, thighs, and feet, and raising watery blisters there, they are of small creatures, that a good eye can hardly discern them. Gabrianus faith: Unro our times a kind of filthy torture that is not to be endured, is continued, a very small Lowie, not so great as a Nit, creeps under the skin. And John Phil. Ingraffias out of Abensuar, describes them very hand-somely
fleely thus: when the skin is excoriated when that small pimple and puth appears like to a red angry wheel, little living creatures creep thither to mall a man can hardly see them. And *fowerlin* writes that Syriones are those that are the smallest of all, always lying under the outward skin, and creep under it as Moles do, biting it, and causing a fierce itching. They consist of a dryer matter than *Mopionis*, which for want of glutinous matter, is almost divided into Atoms. They breed often in the head and eat the roots of the hair. The Greeks call them *mupe*; the Romans *Staues*; some call them *Staues* by a peculiar name. *Syriones* have not a certain form as *Scaliger* well observed, only they are round; our eye can scarcely discern them, they are so small, that *Epicerus* said it was not made of Atoms, but was an Atom it self. It dwells under the skin, that when it makes its mines it will cause a great itching, especially in the hands and other parts affected with them, and held to the face. If you pull it out with a needle and lay it on your nail, you shall see it move in the Sun that helps its motion, crack it with the other nails, and it will crack with a noise, and a watry venom comes forth; it is of a white colour, except the head; if you look nearer it is blackish, or from black it is somwhat reddish. It is wonder how so small a creature, that creeps with no feet as it were, can make such long furrows under the skin. This must obverse by the way, that these Syriones do not dwell in the pimples themselves, but hard by. For it is their property not to remove far from the watry humour, collected in the little bladder or pimple; and when that is wafted or dryed up, they all die shortly after: whence we collect that as they breed from putrefied whey, so again they are sustained by it. None of the Ancients, except *Abinsur* writes of these, who saw this disease, and rightly set down the remedy. Nor are those Syriones of the kinde of Lice, as *John Langius* seems to assert out of *Aristote*; for they live without the skin, but these not, nor do I know that *Aristote* in any of his writings, placed *Acros* among Lice.

How cruel a disease this is, and to be compared with the lowie disease, an honourable English Lady of forty years knowes, she was the most vertuous Lady of *Penrudeck* a Knight, that by drinking too much Goats-milk (for she feared a consumption) was for ten years troubled with these wheal-worms, with which night and day she was inutilely tortured in her eyes, lips, gums, toles of her feet, head, nose, and all her parts, that the lived a very grievous life, alwayes without rest, and at last in despite of all remedies, the disease increas'd, whereby her flesh was consumed, and she died thereof. I must not overpass this, that the more the women that fat by her, picked them out with their needles, the more their young ones breed, and when they had gnawed the flesh aloof, they grew to be bigger. Hence let proud defpicable mankinde learn, that they are not only worms but worms-mean; and let us feare the power of that great God who can with his content with an army confound; all pride, haughtines, daintines, and beauty, and conquer the greatest enemy. It may be some will think it impossible for these Wheal-worms to breed between the eyes; but we see it is so, and we finde it was done so formerly, by an Epistle of *D. Le leuns*, a Chirurgeon to *Jaco Griffins*, his words are these: Know, faith he, that in the conjunctive membrane, or white of the eye as they commonly call it, some great Wheal-lice by creeping up and down here and there, biting will make the place itch so much, that a man cannot hold from rubbing. In this case what remedies the Ancients used against the Lowie disease, but to no purpose. Then my friends fear me to a sick woman, who with a fluer needle pick off these worms to cunningly and without any pain, that I wondred at. And indeed had not I seen these little creatures to creep, with my owne eyes, I could never have believed that Wheal-worms could breed there. They dye for want of myodure that is salt, and are killed with contrary remedies. The common people ordinarily picks them out with a small needle, (the Germans call them *Seusen-Graben*) but since this takes not away the cause of them, which fosters them, the disea flitt abides; wherefore it is best to kill them with an ungent or fomentation, which may at once take off that troublesome itching. That which penetrates most and kills these Syriones is salt and vinegar. *Laur. Fouert. J oh. Arden, formerly the most learned Chirurgeon of England*, faith that a Lotion with Sublimate kills them quite. And it seemes not to be against reason: for it dries, penetrates, refists putrefaction, and by its heating acrimony kills them all. *Abinsur 12. c. 19. toll. 7.* prescribes these following remedies. First purge the body with an infusion of wistle Saff.on-feed, and Nettle-feed, after that anoint it outwardly with the oyl of bitter Almonds, or de *Cherus*, and with the juice of the leaves of Peach-tree: give boiled Partridge for meat, and leavened bread. Let the patient abtain from all kinde of fruit (except almonds) especially from Figs, Grapes, Jujubes, and Apples; rub the body often with the substance or pulp of Melons; or with the Musclasse of the feed. But the body be leathery, rub it with the juice of the leaves of the Peach-tree. *Fings* where there is this disease, fo.bids Oxe-fleth, Hogs, Geese, and all kinds of Fulle.

*Erinis I. de paf. mut*, writes thus: Wheat tempered with Wine, adding thereto powder of Frankincence, putte to the parts afflicted for a plaudiis will kill thee Wheal-worms every where, chiefly upon the cheeks andtoe-heads. *Another* : Take common Salt, black Sosp live Brimstone, eath alike, incorporate them with vinegar of Squils, and anoint the place with them. Another for Syriones on the face, which the Author of the English Role calls *Barrones* : Take shrop Dock, Frankincence, Dragons cutte-bone; eath alike, make a powdere, and thrice in a week rub the places where the Worms breed; but first with you face with a decocation of Brim; and on Sunday wash your face with the white of an egg and white Starch, and then waft it often

---

1095
with river-water, or with white tarch. *Alexander Petramus Triumus* commends this remedy most: namely a fine linen cloth made into lint, that it may be the softer, and stick the softer: bind this to the part affected, then lay on the white of an egg that is hoited hard, whilest it is hot, and cut into large pieces, and then bind upon it some thicker clothes and sof let it remain some hours. Then taking all away, you shall finde the inward lint full of these small Lice, which is thus proved: make this over the fire, and you shall easily heare thee young Syrones crack. Against hair-eating Worms and Mites in the heads of children, that are usual, and that will make little holes in them, *Alexius* makes great account of this remedy. Take Frankincense, Boles-grease so much as you please, let them boyt in an earthen vessel that is glaided, and make an unguent. *Another*: Sprinkle on the powder of burnt Allum, and lay on on lint. *Another not uneffectual*: Powder quick Bristmone, with Rose Vinegar of Squills, or else incorporate it with Rose-water, and bind it on with a cloth for 24 hours. *Another that is most certain*: Take juice of Lemmons and Aqua vitae, each alike, burne Salt what may suffices, mingle them, and anoint with them often. *Another of Hildegard*: Apply that skimming of the air, ifs, those cobwebs that are scattered in Autumn, and it will certainly destroy all those Syrones, and little worms. Also flew on the powder of Bees that are dead in their hives, on the places affected, and they will all dye, chiefly if it were mixt with Aqua vitae, or Vinegar of Squills. *Again*: bind on the crums of white bread whilest they are hot, do it often, the heat will kill them. Fir-tree seed burnt to ashes, which grows on the top of the trees, if it be strewed on, will help much. Also to the kernels of Barbereyes, powdered and laid to the places, will kill Syrones. *Johns Figo* prefcribes these remedies against Syrones wherefoever they breed. All bitter things, faith he, are good against them, have the part affected, that they may penetrate the better. Oyl of Var- triol warmly and lightly powred on will kill them mightily. Quicksilver with French Soap and a little Orpiment, and some Vinegar of Squills and some Aloeis, doth much good. *For Syrorns in the Teeth*: Some call the Worms that breed in mens teeth Syrones, which they affirn have fallen forth like havings of Lure-frings by the smoke of Henbane-feed, received at the mouth. Though I should truly deny these havings are Worms, yet that Worms breed in rotten teeth Barbers and every man knowes. *Against venemous Syrones*: Abinsuaris cals it the diseafe of Oxen, between the flesh and skin there breeds a kinde of venemous Worms; which raiseth no small tumour, as great as a walnut, wherein the Worm Syro lies hid, (he is venemous indeed, though he be but little). This diseafe neglected will kill. He appoints the Remedy thus: The place must be prestly burnt with an actual cautery, then apply lint with Barly-meal and sweet water: when the pain of the burning is over, the humour will fall being anointed with Unguent of Agrippa and oil of Rose, then wash the place with water of Honey and fire on powder of Rose; and then using incarnatives, lose up the wound. But if the part cannot be cauterized or cut, take Lupuncture-meal, Soot, Pepper, root of Endive, each alike, and bruizing them all, and wetting them with Alchitra, fill half a Nuf-fhel with them, and keep them on fo long, till the force of the medicament may penetrare to the Worm: but great care must be had that no part be left bare without the shell. A little creature called Nugas, as Thevet imagineth, doth much vex the Well-Indian people. It is faith he an Insect most offensive to mens hands, far less than a Flea, but breeds in the dut as a Flea doth. *De Lory* was taken with the same oversight, and was not affhamed to be mad with Thevet for company. But Ovidius affirns that they breed between the skin and the flesh: but especialy they breed under the nails of the fingers, into which places, when once they are rooted, the caufe a dwelling as great as a peale, with a mighty itching, and they multiply like to Nits. Now if this worm be not timely pick forth with its brood, in a few dites this itching becomes a wonderful pain, and the tick dye with the violence of the diseafe. There is a Worm that breeds on the bodies of Hawks and Faucons under the roots of their wings, it is called Troliae: we have left off to doubt any longer whether it be a Syran, Aearus, or Tinesor not, by reading Albertus his Book, wherein you may read a remedy for that diseafe at large. Also, as *Bonacivus* reports, in the urine of some womens with child, little red Worms called Syrones will be seen, which are a certain argument of conception. *Demneus* is an Insect that will consume skins, and from skins hath its name, and as the skins vary, so that changeth its colour. For oftentimes it follows the colour the skin is of: it is as big as a Flea, with fix feet and a forked nib. Also a Moth consumes clothes, especially woollen clothes: for it is a very devouring creature, and breeds from Butterflies as I said.

**CHAP. XXV.**

**Of Wall-lice.**

The Greeks call it *Xileos*, the Latins, *Cimex*; the Hebrews, *Nechphekes*, from seeking; for it seeks after living creatures that are asleep, to suck their blood. *Ephes* will have it *xileos* and *Cimex*, from the herb *xileos*, which they call *Cimicaria*: I confess ingeniously I know not what heb it is, unless it be that low and flinking kind of wide Orach, which growing near to walls and heaps of dirt, is called by a bowdy name, *Vulcavda*. *For Coris of Mathius Linn*
well, and therefore agrees not with Cimicaria. The Arabians and Barbarians call it Alcarado, Debllion, Pejasfe, Correa, and Corah; the Germans Wantimz, the English Wall-louse; the Swons Wantian, that is Wall-lone; the Brabant people call it not amifs Wregleys or Lowic of bed-teds; the Spaniards call them Chimefas; the Italians Cimici; the French Panifes. Now Wall-Lice are either home-bred and without wings, or winged and wilde Lice. We spake of them in the first Book, now we shall speak of those that breed in houses.

This home-bred Lovie is a creature natually distained, to use the words of Pliny, it is almost like to a Tike, for the body of it is of the figure called Rhomboida, black of colour with a little red; it hath short feet near the neck, on each side three, and the belly and back marked with incisions; the skin is very thin that it will break in pieces with the least touch, and send forth a molt abominable eink. In the night by bigning thatply, it lackes blood out of mens bodies to sustaine it self. For like Moths it cannot endure the light, and when the day breaks it will go into chinks of beds and walls. After it hath bit it leaves behinde purple spots swoln with an itching pain. They are bred, after Aritfeters opinion, from moisture that sweats forth on the surface of the bodies of living creatures, la 5, c. 31. biffer, but without doubt they arise from other humour corrupting about beds, and that sweat out of wood by degrees. Also they propagate by copulation, as Pennius oberved about Orinda; for whilest he kept company with a Spaniard bornat Capera, he trie to draw his sword to cut off a bough: but when he could hardly do it for the rail, he was forced to cut his scabbard, where he found abundance of great Wall-lice, with a great company of young ones, and a multitude of whitish eggs of a variy complication. Scaliger faith they will breed in Horns, and also in a score time they will infinitely increase in the Qutsiells. They are frequent in Fir-tree beddies, and chiefly when the strawgrows old. Also they will breed in paper-books. Lucius Vives in his Dialoges, thinkst that walts overcall with Albather are the most ready to breed Worms. It is commonly laide (faith Ippolito Scaliger) that Wall-lies will breed from Wall-lice bruized, which is hardly credible. Cardan that was a fancier of subtiltis, writes that the Cartburnians are never vexed with Wall-lice, and he gives the cause, because they eat no flesh. The beds at Telnus (I use Scaligers words) eat no flesh, yet they are noted for breeding Wall-lice. He should rather have allledged their cleanliness, and the frequent washing of their beds and blankets to be the cause of it, which when the French, the Dutch, and Italians do likewise, they more breed this plague. But the English that take great care to be cleanly and decent are seldom troubled with them. In the year 1503, when Pennius writ this, he was called in great halfe to a little village called Morlock near the Thames, to visit two Noblemen, who were much frighted by perceiving the prints of Wall-lice, and were in doubt of I know not what contagion. But when the matter was known, and the Wall-lice were caught, he taught them out of all fear. Against those enemies of our rest in the night, our merciful God hath furnished us with remedies, that we may fetch out of old and new writers, which being used will either drive them away or kill them. For they are killed with the smoke of Ox:e-duc, Horfe-hair, Swallowes, Scoiopendra, B:imifone, Vitriol, Arfenick, Verdigeantes, Lignum Stoeyes, Bideolum, Fern, Spurata Parida, Birthworh, Clematris, Myrtis, Cummin, Lupins, Knogeants, Gith, Cypresses, as we read in Actius Rhogis Flereantum Didyman, and Cardan. But the best way is with curtains drawn about the bed, to shut in the smoke, that it can have no vent. And so this end ungentis, omentae, Embrocations are provided of all of an Oxe, he Goat, Hedge-hog, Calf, the Goat, Afe, with the leaves of Cucumber and Ivy, Citrons, fuc-glaes, Oyl lees, Oxe dungs, and the harpelt Vineagar, quick Birmifone, Squis, Capers, wille Sceastes-aere, Woundwood, sweet Wine, Lime, Quickeilver, Bayes, black Soop, winter Cherrys, Joyce of Oranges, Lemos, &c. whereof conuitl Varro, Palladins, Armadins, Didyman and others: what concerns Petersention means, Hemp-feed, or winter Cherrys laid near the bed, or hanged up drive away Wall-lice. De morbus faith, that Harts-horn or Hares feet hanging about the bed-pollis, will do as much: which another author ascribes to a Foxe ear. The dress of boyed better call well: when there are Wall-lise, will wonderfully kill them, for they will feed on that till they be dead. May be that this is that fat whereof Cardan speakes in these wordes; I know nyce, faith he, but I have forgot, if a matter being imered on a wooden round circle, would so allure all the Wall-lise unto it, like a charm, that one could scarce see the wood for them. Some say that a half-penny laid under the bed will drive away Wig-lice. Some hang by a fleer wet incold water, and by actual cold they drive them away. Oyl of it self or with Viniol, or Buls gall, or the decoction of black Chanteloons will drive away Wall-lice. Moreover all things that are exceeding bitter, and have a stronger smell, are doubtles good against Wall-Lice. And that strong smelles will drive them away. Olum Magnus thesues by many raw hides heat up together. Alexander Benediks faith that when these multiply much, they forebode the plague. For it signifies a corruption of the air, or humours, or both. Bacchus decending to hell, as the Greek Comedian wittily sets it down, defied Jupiter to affhirm him such Innes in his journey, where there were but few Wall-lise: yet faith Pliny, that concord and dicoz, which fills all Phyicks, by the conduct of nature hath produced nothing that in some part is not good for man, and therefore that which Co
median God thought hurtfull, mans potterity kath found beneficiall. Indeed wall-worms are of a corrodng quality, yet have they place in Phlyck ; for taken with the blood of a Tortoise they cure the bites of Serpents. By their smell the Epileptie that ariseth from the stran@gling of the Mother, is disussed. Inclined in an Egge or Wax, or a Bean, and swallowed, are good for an Impoilume, and a Quarta. And, will help them (faith Pliny, Difforetis, Galen, Mecelius, Aetius, Altairius.) Drink with Vinegar or but must to, they will remove Horfeleeches that lick too fatt. Also the Verfes of Quintus Serenus fhew that they are good for Tertian Agues.

Shame not to drink three Wall-lice mixt with wine,
And Garlick bruised together at noon-day.
Moreover a bruell’d Wall-lice with an Egg, repine
Not for to take, ’tis loathsome, yet full good I say.

Geuen in his writings confirms this experiment, having made trial of it amongst the common and meaner fort of people in the Country. The Ancients gave seven to those that were taken with a Lethargy, in a cup of water, and four to children. Pliny and Serenus confents to it in thefe Verfes.

Some men prescribe seven Wall-lice for to drink,
Mingled with water, and one cup they think
It better then with drowsy death to sink.

And he of old fang, that bleeding at the nose would be stayed with the only smell of Wig-lice. Some there are, that cure dark fights by rea<son of a Cataract, bruizing thefe with Sale and Afles milk. Many annoyant painful ears with honey mingled with Wall-lice, to good purpofe. Alfo Marcellus faith they stay vomiting, and he faith it is a certain remedy, if a bruifed Wall-loufe be swallowing in a rear-egge, by one that is fawning, and knowes nothing of it. Pliny feems to prove from thence, that they are good againft the fits of all Vipers, Adders, and all kinde of Serpents, becaufe that Hens that feed on thefe, are free from the fhing of thefe Creatures. Aetius commend Wall-loufe againft the Strangury, and to drive forth the Stone. Vegetius in this cafe puts one Wall-loufe into the ear, another into the paffage of the Yard, and with a gentle ftrick of the parts, he affirms that they will presently make water, which remedy he faies to have borrowed out of Hesiod in his Hippatrickes. Galen Exp. 5. reports, that Wall-loue will not only provoke urine, but alfo drank for nine daies fpase, will flop children water that goes from them againft their wills. Valerandus Domines an Illander, a moft learned Apothecary of Lyons, often faid, that thefe drank with water hot, or wine, or broth, would wonderfully help thofe that were troubled with the Stone. Moreover, the latere writers wonderfull commend the ashes of them with a fift decoction cauf’d in a Clyfter, to bring forth the Stone. If they be bruifed and annoyant on the paffage of the yard, it will presently provoke urine. Marcellus. There are faith Geuen, that for the Colick prescribe four live Wall-lice to drink in wine, in the morning, and then they command to fift two hours after, and they give as many to drink two hours before fupper, and fo again the next day until they have drank up twelve Lice : truly it is a remedy to be depifed, but it is no new remedy in that desperate difaffe, and it is a prefent cure. It helped Funditus the Governor of Zurick at the fsecond taking, and fo it did fome of his Kindred also, and he was like to have written a commendation in praife of Wall-loue. What concerns outward difafe. If you pull up the hair by the roots, and annoy the part affected with the blood of Wall-loue, and let it dry, it is the opinion of Galen, Aetius, and Nonius, that they will never grow again. Pliny faith that if you annoy the breaths with Goofe-greafe and Wall-loue, the pains will abate, the Moles of the matrix will break forth, and fcabs of the privities will be cured. Cornelius Germa in his Appendix of his Cosmocritica, speaks of a woman in whose Skull opened, were found abundance of Wall-loue.

Chap. XXVI.

Of Tikes, and Sheeps Lice.

The Tike in Latine Richins, in Greek Ρηχιον, Hebrichim calls it ע"בבבם, Suidam אבבבב, and others call it סינימ, Siphonimus calls סינימ, but that is not right, for it wants wings. The Arabians call it Albauar, Alphiates, Albeimus, as Bedamus reports. The Perfini, faith Heimo-

laus Barbarus, to this very day call Tikes γεγόνει, as we read in Dianius Zelometes. It is called Richins in Latine, becaufe it is like the feed of the Plant Pulma Chrifti. Geza calls it Redwiam, and Alberti sometimes calls it Taca. Alfo Albertius Vincentinus, Guillerimus de Coma, call it Eugenem. I think that at firft it was called Cier, faith Staligers, because Cie is the fame with Cretan. The Italians call it Zvea, the Germans Heliebehck, the French Plata, from its compact body, the English Wood-teeck. Some diaminifh between Richins and Redwiam, thus very exadtly.

Richins
chap. 27.

Of lesser living creatures.

Rhus is a small insect, that when Summer comes on breeds in pastures among grass, and in woods amongst the leaves, of some putrid humour: with a very compact body and that feels plain, with a skin very tough, of a Diamond figured body, of a black shining colour, or a dark brown; but so soon as it fasteneth to any living creature, and thrusting its head within the skin, it draws the blood, in a short time it grows great and swells, and at length becomes almost round. It hath six feet fastened to its neck, with a sharp nose, but short, it produceth no young ones, nor is it produced by other living creatures, and in this it differs from all other insects, that it is filled with food abundantly, and yet there is no passage for any excrement, and therefore it may be the Hieremian call it Case. Let therefore the material philosophers that with Aphrodite draw all things from the manifest qualities of the Elements, consider diligently, to what defect of matter or confusion they will be here forced to fly. If they imagine, that Nature wanted a skin to pierce a hole in the tail, they deferve to be hissed at. But rather let them here fee and acknowledge that of Persulphur: That bodies may be made from Sprits, and Spirits from bodies. They calls a Tike a filthy creature, the end of whose glutony is, as to gluttones amongt men, death it self. For in a few days it will break with over-fullness; yet it will falt lustily for seven days. I scarce consent to Scaliger, who supposeth Tikes will breed in a mace beard and groins, for being there fasteneth it will lick close to feed itself: yet Isaphatius and Hrisbiae are of his side in these words. It is called a Tike, because it thicks fast to what it is bred in. But the truth is, a Tike is not bred in living creatures, but from the corrupt matter of leaves and grass as I said before, and as Ariftotele affirms, Hist. 5. c. 19. Tikes breed of Plants. May be Scaliger meant by a Tike some Lowe like a Crab, or some Crab-lowe in man; for they both breed in the beard and privities, and can very hardly be pulled off. It cruelly plagues men and Oxen, but especially barking Dogs. Cato also testifieth that Sheep and Goats are troubled with Tikes, but he was deceived by the likenesse of their bodies, for that Lowe of Sheep should be called Brussius, our Country-men say (a Sheeps Lowe) between which and a Tike there are many and different marks: For a Sheeps Lowe hath a long little beck, and its body when it is fullfed is never so distended but being pressed, it will never seem round. Also the feet of this are of a dark red, the back Ash-coloured, marked with three black spots, and it is framed after the fashion of a heart. The head is not always but feldom full in the skin, and it draws blood forthly but by turns, and it voids the excrements that breed of it by the tail, and it will dy Wool of so deep a green, that this cold tincture shall scarce be bettered in a hot dying Fat. Sheeps Lice will live a whole year in thorn Wool; but Tikes live only upon the hot blood of the creature. Let therefore Cato maintain them both to be of one kind, yet truth will maintain a vast difference between them. Saxo is a little creature, like to the swellings of leprous people, faith Alberius. Gisner doubts whether he understand by that a Tike or a Breetz; I rather think he meant a Tike, both from the round form of the swellings, and from their wan colour. Cato frees thorn Sheep from Lice with Oyl less well putrefied, and the beet lees of strong wine, and a decoction of Lupins added to them, and anointing them with it, then let them dry two or three days, and after that wash them with Sea-water. The English Shepheardz therethem, and then anoint them with Tarre and Sheeps feet, or else they bruise the root of Acorns, and boyl it in water, and they foment their bodies with the warm decoction. Some use nothing but Tarre, others use the root of Mandragora; but care must be had that the Sheep take it not, for fear of the great danger of stupefaction that it will cause. Others boyl the root of Cyril, and with that boyled they wash their Sheep. Diochares in Geopeon. Against Dogs Lice the Ancients bid us to anoint their ears with Oyl of bitter Almonds and of Walnuts; experience confirms that remedy. Also Nemoferius testifieth as much.

'Tis good to rowt their ears, and set them in the Sun, Or use red hot knifes when Lice are first begun.

Rhufis commends against Aescharid of Dogs or Dog-lieve, to wash them with Wine, and Vinegar, Cummin-feed and Salt-water. Themasithius and Cato prepare Oyl of bitter nuts, and with that they anoint their claws and ears, and sects also. Tarre of Cedar kills them. Diocharid. But Columella forbids to pull off Tikes from Oxen and Dogs, left the places should exculerate, and he highly commends Tarre and Hogs greafe. Pliny faith the juice of both Chamois will destroy them. Alberius reports that Tikes bloud will cleanse Ulcers, and if they be infused in wine they will presently make one drunk. Seventh farther commends them for to cure Fifula in Ano.

If that new ulcers in the secret chance to breed, cherry'd Bramble-leaves apply, you quickly shall be freed. Oyl from an old face a Fifula do growe, AWithis after burnt will help', and furtherknown, The blood of an Ox Tike to no means else below. Also
Alfo the bloud of a Tike will cure the Shingles. Alfo men say, that a Tike pulled out of the left ear of a Dog, if it be tied on, it will cure all pains. **Piny** write this out of **Niguid**. Alfo he afferts that if a womens loyns be anoynted with the bloud of it, the will abborre venery. Moreover nine or ten **Goats** Tikes taken in wine, will stop the terms. **DiSforier**, Anoynt your eye-lids with the bloud of a Tike taken from a Bitch, the hairs being firft pluckt off, faith **Galen**, **Simpl. 10. c. 5.** and they will never grow again: So alfo **Piny** and **A visitena** write, but it is from other mens opinions. **Dionysius Melellan** prescribes such a Deplatory againft pricking thorny hairs: 
Burn a Sea-hare in a new earthen pot, and keep the ashes with Tikes bloud in a horn box, use this, firft pulling out the hairs. Many **English** men have learned by experience, that one dram and a half of Sheeps Lice given in drink will loon and certainly cure the Jaundies.

**CHAP. XXVII.**

**Of the Garment-eating Moth.**

**Ennius** beginning to write the history of this Insect, faith that **Tinea** is a word that signifies many things; as Lice of Hawk-weed according to **Albertus**, Wood-lice in **Plantins**, the plague of Bee-lives in **Virgil**, and it signifies the creeping ulcers of the head, that are eaten like garments, whence it may be **Claudian** writes;

*The filthy Moths have gnawed the loathsome head.***

**Gaza** translates *Terna*; **Tinea**, but very ignorantly, as we observed in the history of Catterpillar. Alfo **Piny** faith that **Tinea** do destroy the seeds of Figs, he means the Worms that breed in Figs, from whence grow **Jara**. **Nipbus** calls that little Scorpion which eats books **Tinea**, whereas I spake in the history of Scorpions. But *su* and *Nipbus*; if a man will speak properly, is a Worm that eats garments. It is called in *Lateine Tinea*, a term from holding, for it ficks fast in garments, and will not easily change its station. The French call it **Trigue**, the Spaniards **Tindas**, the Italians **Tignola**, the Muçovites **Mel**, the Polonians **Mai**, the English **Moth**, the Hebrews **Hovshach**, and **Sas**, as you shall finde it **Job** chap. 13, and **Isai. 51.** It is a little Worm of a wan white colour, of which ariseth that small kind of Flie that will fly at night about the Candle-light. There are some of them that are silver-coloured, the English call them silver-moths, the Dutch **Sibwet**, from their swift motion. **Nipbus** greatly erred, making this the Scorpion amongst books. There is also a certain Worm that is thick, or with a coat. faith **Piny**, called **Tiera**, that draws its coat along with it, as a Snail doth its shell, and when the is deprived of this featherly diete. But if this coat grow too great, it changeth to a **Chrysalis**, out of which a fet time a little Glow-worm comes. This kind hanging by a thred, hangs a long time in houfes before it changeth to an Auralia. It hath a little black head, the rest of the body is a whitish brown colour, the Cafe of it is something long, made almost of a Cobweb, not round at all, but lightely compacted, and at each end something hairy. The Phaene that come from thence flick by the feet to the roots of houfes, un- till their bodies being corrupted and putrefied they are bred again: when their bodies corrupt, and their wings and feet fall off of themselves, they hang with a thred by the tails. At length they get a Cafe and are turned into this kind of Moth. In **Germany** and **Helvetia** there is a Moth of a faid red colour, with a little thick head, the body grows by degrees smaller even to the tail. The colour of its belly is lighter, something yellow, and like a soft downy filk. It is very tender Creature, especially that which is fiver'd over, and it is bruied to pieces if you do but touch it. Whence that Kingly Plaimiff, **Pfal. 32. when thou with chaffements flaitt corret man, thou makest him to confume away at a Moth.** And **Job**, **Chap. 40.** he amplifying the certain deftroction of the wicked: **They fhall be bruied (faith he) before the Moth.** All Moths are reckoned amongst the number of fix-footed Creatures, and they breed in Garments as well of Wooll, as skins that are not cleansed from dust and fift: and fo much the sooner if a Spider be flut in, as **Ariftotle** writes. For the Spider drinks up all their inbred moity, and dries them; wherefore care muft be had that garments be not laied up full of dust, and when the Air is thick and moity. Some to avoid Moths, ventilate their garments in the hot Sun-thine: which our women severely for bid, and lay them up in the shade, and when the winde is high and very cold. For they hold that the Sun-beams are kindly for Moths, but windes and tempefts and the shade are enemies to them. These Worms when they have by degrees inefibly eat off the outmost superficies of the cloth, then they eat up the inward part, and fo infimulate themselves into the middle substance of it, that those that search never fo well for them can hardly finde them. The Ancients were moft expert to kill Moths. For the garments of **Servius Tullius** failed to the deftroction of **Sejanus**, for they were kept with fo great diligence by the keepers of the Wardrobe, that they neither confined by age, nor were Moth-eaten. They that fell woollen Clothes,ufe to wrap up the skin of a Bird called the **King's-Fisher** amongt them, or else hang one in the hop, as a thing by a secrect Antipathy that Moths cannot endure. They are handomely destroyed by the fent and smoke of Savin, Hops, Finger-wood, Wormwood, Rosemary, Poley, Panax, Anifeed, Golden-flower, Pomegranates, Citro-
Of lesser living Creatures.

CHAP. 28.

pills, (for this was the chiefest use of Citrons in old time) the out-landish Myrtle, Cedar, Cypress, Calamint, Brimstone, Downy feathers. The Books that were found in Numa his Tomb, were said to be anointed with the juice of Cedar, wherefore as Pliny writes, they were supposed to be free from Moths above 350 years. The bones of Bergers (I know not what beast it is) being brought to powder, and these amongst garments, will drive away Moths, if we will credit Hygeian. Nemesius reports that Cantharides hung up in the middle of the house will do as much: Who fears moreover that garments wraped up in a Lions skin, will never have any Moths. Some wet a linen cloth in a strong lie, and dry it in the Sun without pressing it, and they affirm, that clothes wrapet in that will not be Moth-eaten. Cato bids sprinkle your Wardrobe with Oyl-lees. That which Pliny reports is a wonder, that a Cloth laid under the Bieten of a dead body, will never have Moths to hurt it. The richer people, who (as Horace writes)

Whose hangings rot in Chefs, rich for the Worms and Moths,
take diligent care in Summer to look up their garments, and taking them out of their Coffers, they air them in open place for the winde, and then they beat off the dust with the leaves of Indian Miller, or Hogs bristles, or Broom Moffs, or with Worm-wood branches. Of old they were wont to do it with an Oxtail; for so Martial writes;

If that with yellow dust thy costly clothes adorn,
Then most with an Oxtail bruft off upon the ground.

There are also rich Merchants, that have Cedar and Cypress Chefs, and they put up powder of Origamum, Worm-wood, Orris, Citron-pills, Myrtle-berries with their clothes, and by such remedies they drive far from them this Wooll-devouring Creature.

We write before amongst the six-footed Worms, of Worms in books, wood, the skin, the fruit devourers. I have nothing more to add to this Chapter, but only to exhort rich men to lay up their treasure there, where neither Moths shall eat their garments, nor rust confume their Silver; and let them in the mean time leave off that infinite expense in clothes, of which can they look for any better end, to use the words of the Lyric Poet,

Than to feed black Bugs, and the Lazy Moths?

If a man, faith Calvin, born of a woman, having but a short time to live, and always waxes old, and corrupting, would think himselfe to be like a garment that Moths eat, certainly he would lay aside all pride, and blith, and fall lowly upon his knees unto Almighty God.

CHAP. XXVIII.

Of the Flea.

The Latin word Pulex, in Greek Πυλος or Πυλη, comes faith Iphigene, from Pulvis, dust, or the ion of dust; in Spanish Pulga, Italian Pulzes, French Puce, English Flea, the Germans from its nimbleness in flight call it Fliech. Fleas are not the least plague, especially when in greater numbers they molest men that are sleeping, and they trouble wearied and sick persons; they escape by skipping from us, and so soon as day breaks they forsake the bed. They are a vexation to all men, but especially, as the wanton Poet hath it, to young maids, whole nimble fingers, and that are as it were clammy with myrture, they can scarce avoid. These Fleas are either common or extraordinary. The common ones are small Creatures about the bignesse of Life, but their bodies are softer, and they are bunch-backt, almoft like a Hog, they are black and thinning, their breast and belly is yellow from black, in white Dogs they are more clear, in red more yellow, in black Dogs blacker than in others. Here I desire you to observe the wonder of Nature, that their hinder little legs are bent backwards toward their bellies, and their forelegs toward their breasts, as four-footed beafts are, as it is usual almost in all Insects to whom Nature hath given but four feet. It may be for that end the joynts of Fleas are so dispofed, that they may with the more ease hide themselves in the long foldings and plughts of the blanket from those that hunt after them. The ends of their feet are divided into two parts, and are hooked and sharp, and seem as it were to be bony, not only that they may more fully creep up upon high places, but also that they may fix and stick faster to the smooth skin: They have a little head, and a mouth not forked but strong and brawny, with a very short neck, to which one Mark an Englishman (most skilfull in all curious work) fastened a Chain of Gold as long as a mans finger, with a lock and key so rare and cunningly, that the Flea could easly go and draw them, yet the Flea, the Chain, lock and key were not above a grain weight: I have also heard from men of credit, that this Flea so tied with a Chain, did draw a Coach of Gold that was every way perfect, and that very lightely; which much sets forth the Artills skill, and the Fleas strength. The point of his nibe is something hard,
hard, that he may make it enter the better. It must necessarily be hollow, that he may suck out the blood, and carry it in. They seek for the most tender places, and will not attempt the harder places with their nible; with two very small forayords that spring out of their foreheads, they both prove their way, and judge of the nature of the object, and whether it be hard or soft: where they bite they leave a red spot as a Testimony of the force with which they fast. In rainy weather they bite freely, and are bold to run over ever part of man body. They have but one small intellect, with folds inward, which is either relaxed or contracted as they eat more or less.

The lesser, the leaner, and the younger they are, the sharper they bite, the fat ones play and tickle men more willingly. It is very probable that they have eyes, both because they cleanse their places of retreat, and because they withdraw themselves when the day breaks. They will not stick upon corrupt or dead flesh. Those that have the Kings evil, because they are of bitter juice, and such as will die, because of the corruption and stink of the same, they will not meddle with. At all times they trouble men and Dogs, but chiefly in the night. Though they trouble us much, yet they neither sink as Wall-lice doe, nor is it any disgrace to a man to be troubled with them, as it is to be lowly. They only punish sluggish people, for they will remove farre from cleanly houses: when they finde they are arraigned to die, and they feel the finger coming, on a sudden they are gone, and leap here and there, and fo escape the danger: whilst those that hunt them endeavour to measure their jumps, as Aristophanes faith, they but play the fools. In the morning, after they have fed, they creep into the rough blankets, and flick to the walls, or else they hide themselves in the ruffles or duft; and so they lurk in ambush for Pigeons, Hens, and other Birds, also for men and Dogs, Moles, Mice, and vex such as passe by. Our hunters report, that Foxes are full of them, and they tell a pretty flory how they quit themselves of the same. The Fox gathers some handfuls of wool from thorns and briers, and wrapping it up, he holds it fast in his mouth, then he goes by degrees into a cold River, and dipping himself in by little and little, when he finds that all the fleas are crept to high as his head for fear of drowning, and so for shelter crept into the wool, he barks and spits out the wool full of fleas, and so very frolickly being delivered from their molestations, he swims to land.

Their first Original is from duft, chiefly that which is muffled with masts or Goats urine. Also they breed amongst Dogs hair, from a fat humour purrified, as Scaliger affirms. A little corruption will breed them, and the place of their original is dry filth. Martyr the Author of the Decade of Navigation, writes, that in Peruena a Countrey of the Indies, the drops of sweat that fall from their live bodies will presently turn to fleas. Some Countreys are such enemies to Fleas, that if they be brought in thither they cannot live, nor will they breed there; as in the Territory of Seflor of Sigismund. Contrarily the City Hea by the sea-fide, (Unleffe John Leo deceives us) is most fruitfull for Fleas, by reason of the abundance of Goats, as also Dede. In Hispaniola Fleas are found, but neither many, nor great ones, but they bite more fiercely by farre than ours doe; they love hot places, where the Sun shines. In the Spring they multiply, and at the beginning of Winter they die, for they cannot endure the cold. They copulate, the male ascending upon the female as Fleas doe, and they both goe, leap, and rest together. They flick long together, and are hardly pulled asunder. After copulation presently aimoile, the female full of Eggs seems fatter; which though in her belly they feem long, very small, very many, and white, yet when they are laid, they turn presently black, and turn into little Fleas, if we may grant what Pennius faith, that bite most cruelly. Philemon in lib. iie generat. maintains that Fleas breed not Eggs but Nits, and Nipsis faith the same: But they endeavouring to prove this because they crack when they are cruyf, doth not confirm their opinion, for Fleas will not break under the nail without cracking. Aristote thinks, that from them, be they Eggs, Nits, or little Worms, no other Creature breeds, and I should willingly subscribe to him, but that I think Nature made nothing in vain. Those Fleas seem to be more rare that India produceth near the River Nigua, as we learn from Trewet. They chiefly seize upon the softest parts of the feet under the nails, and bite venomously. After four days they raise a swelling as great as a peafe, or a Chich peafe, and young ones like to white Nits; and if these be not forthwith picked out, and the place affected burned with hot ashes, the part will be loeft, as it falls out often with the Slaves in Numidia. He also in the Province of Peru was subject to this mischief, and could not recover but by washing himself in the River very often.

Cardan writes of a little Flea. The West Indies, faith he, brings forth a kinde of Flea called Nyge, a very threfold plague. This creature is far leffe then a Flea, that tickling to a man will fo torture him, that some lofe their hands, others their feet. There medy is, to anoynt the part with Oyl, and shave it with a Rasor: To whom Scaliger answers thus. Thy story of Nigua is lame, yet not unprofitable if you consider Philologie: I shall adde what you have omitted.

This little Flea hath a most sharp nimb, and invades chiefly the feet, (seldome other parts) not only when men goe, but lye down also. Therefore the Indians lie high. Most frequently they bite that part which is under the nails. The fourth day the swelling begins to increase, and grows to the bigness of a great pea. This swelling is full of young Nits; they pick them out, and lay on hot ashes. Birdes are said to eat the same. The Indians write, that with venomous Insects. Amongst the rest the Nigua about the bigness of a Flea, insensibly creep in between the flesh and the nails especially, and they are bred in the duft. It falls out oft times that no pain is felt by them, till they grow as great as Chich peafeen or Lentes; and then with a wonderful plenty
plenty of Nits bred, they are hardly pick out with a needle or thorn; and this mischief is cured with hot athes. Moreover, the slaves of Africa that the Spaniards have in their families, because they go barefoot, are thereby troubled with this plague, and they breed in such numbers in their feet, that there is no remedy for them, but the iron instrument of the slave, whence many of them want their toes or their feet. Fleas will dye from extreme cold, and therefore in the colder winter they are not to be seen; or else we kill them when we can catch them. And one dog will as willingly bite out the Fleas of another dog, as they will scratch one the other. Also a most bountiful Nature hath furnished us with a large field of remedies, that the Fleas that hide themselves, and leap away from us, may be destroyed by us, and we prevent their spreading. For we have herbs, Dwarf Elder-leaves, Fennel-foot, or Anthos, flowers of Penniroyal, Rue, Colo- quintida, Brambles, Oleander, Mints, Hodmints, Hops, Rape-seed, Camom, Staves-acre, Fleabane, Cony, Saffron, Coriander, Gentian, Sweet Cods, wilde Cicers, Arfemart, Mustards, Lupins, roots of Chamaele, Hellebores, leaves of black Poplar-tree, Bayes, Walnut-tree, with the oyl of these, or the boyl’d decoctions, if the pavement be sprinkled, or the house be perfumed, the Fleas will be gone, and most of them are killed. Above all, the dregs of Mares-pote, or seawater are commended, if they be sprinkled up and down; also Harts-horn burnt is very good. Goats blood set in a basin or a pit draws all the Fleas to it, as also a flaffe anointed with the fat of a Hedgehog or Cony; Axe, Bear, Bull, or Fox, will do the like. The water of the decoction of Arsenic or Sublimate sprinkled, is a certain experiment to destroy them. Quicklime mingled with the juice of white Hellebore, doth the same. A Gloeworm set in the middle of the house, drives away Fleas. Fleas-wort in the City of Chaire is powdered, and the powder is strewn ab the beds, which, by its smell doth astonish the Fleas that they will not bite. If a Flea get into one of Peter’s oyl, will live; if it be sprinkled up and down, it will die. The remedies which I have here mentioned, are taken from Appyrians, Taros, Columella, Gales, Actius, Palladins, Aquicorns, Raphis, Kiramides, Guillifuns, Placentiums, Vfracinus, Belliniaeus, Hermodus, Barbanus, and Pliny. The Barbarians (faith Lcucu) that the Fleas may not bite them, anoint themselves with oyl that is thick and red, pressed out of fruit, which they call Convex, Petrae Califardi, Cecina Chateguins and Tzer- zees, are reported to have written the commendation of a Flea; it was my desire to have seen this, but it was never my chance.

CHAP. XXIX.

Of Insects that want feet, and first of Earth-worms.

Some earthly Insects that have no feet are bred in the earth, some in living creatures, some in planes. Earth-worms or Lumbrici, are called Plana, and Calumella, may be from their liquidity. Also they are called the entrails of the earth, both because they are bred in the bowels of the earth, and because being pressed like the entrails of living creatures they can forth after excursions, so also because they are like them in form and fashion. The Greeks call these Ledou, Erda, Haploopus, and the Syracusians, and the English Meds, Earth-worms; the French, Vres de Terre; the Italians Lumbrich; the Spaniards Lambrioz; the Germans, and those of Flanders, Erdwurmen; the Arabians, Aetarts, Manardus writes, L. 2, op. 4, that Earth-worms were called Ovifculi. Earth-worms are greater in lesser.

The great ones are long Worms, almost like those round ones that are bred in ments bellies, half a foot long, and stretched out a foot long; they are of a weak flesh-colour, and for the most part they have a ring or scale a collar about their neck that is thick, wherein there is a little blood contained: they have no eyes, nor Worms have any. They first breed of putrefied earth, they are afterwards fed by the fame, and lastly they are resolved to earth again. Tho’ they be wounding little hills at the brink of their holes, as I suppose those heaps are their exections; for in them we finde nothing but earth, the nutrimental juice whereof being spent, they cast forth the rest as unprofitable matter at their doors, and they are fenced by it against the rain falling in. At night chiefly when it is rainy weather, they willingly copulate, and flick fall till morning. They are not wrapt together in copulation like Serpents, but they stick fast together by their sides, sending forth a frothy kind of spittle when they copulate: when they are in conjunction, they keep the middle of their bodies, that is the hinder half in their holes, and they are never so fast glued together, but with the least motion of the earth they can easily part: in rainy weather they are whiter, unless it be when they copulate, for then especially they are red. Gcphalae in the middle of April he difsected a female Earth-worm, that was very thick, within the flesh through the whole body, a receptacle descends, that is ringed, covered with a thin membrane: when he dissected it, it flank filthily: in this is the earth contained that they take in; but above this receptacle there lie white eggs very many helped together, next the mouth.

The lesser Worms, for clearer description sake, I will with George Agricola call Aforacides, they are frequently found in dung-hills, and under heaps of stones: some of them are red ones, they call
call them *Dogs*, and *tiers mch define them; some are stark coloured, others have *yellow tails*, and are so called; some also use with clover and are far others without clover and licent, which I take to be the males. *These are bred chiefly in Autumn by reason of no plenty of moisture, as Aphislate* seems to affirm. Both kinds live long in water, but at last they die for want of food. They move from place to place with a certain drawing and pulsation, for the Philosopher faith they do not pocrally tumble along. The great one live in the bowels of the earth, especially in the open air, and where men oft-times resort. In the morning when they withdraw themselves into their holes, when the air is clear they fence them with earth caft up, but in rainy weather they flop them by drawing in some flake, they feed frequently on earth, but moist greedily on a piece of white bread unleavened, as I learned from our Turner, a very credible man and have oft-times seen it. Many of them dye it the Winter too cold, or the Summer too hot. Moreover they are taken by Fishermen, and driven forth of their holes either by digging and flaking the earth, or by pouring in some liquor or strong juice, as of Walnut leaves, Hemp, or strong Lyce. It is good also in tempestuous and dark nights to go into gardens silently, (which they miracely hurt) and to creep upon them when they couple, by the help of fire carried in a horn: for so in one night thousands of them may be intercepted and killed.

Liles of this defpicable creature are obtained to be many; and Nature scarce affords any simple that the hath bellowed more vertues on against diseases. For Earth-worms softest, sweet together, easie pains, and by their earthly and watry moisture together, they duly temper the part affected. Powder of Earth-worms is thus prepared: Wrap up great Earth-worms for some time in earth-motes, that so they may free themselves of that glorus matter that sticks on their outward parts; then press their hinder parts next the tails that they may cast forth their excrements and be cleansed. Then cast them into a vell of white Wine and a little Salt, and gently prelling them with your fingers, cast away that firt Wine: pour on more, and after the Worms are washd, take some part of this away also: for it must not all be cast away, as some would have it, till it be perfectly cleansd, for so that glorus clamy qualy would be lost with it. Thus prepared, they must be gently dried in a furnace, till they will crumble into dust when you touch them. Then the powder being beaten and feared (it will smell like Runner or Cheede) must be kept something far from the free in a glass vell. Otherwise it is best to kill the Worms in pieces in Wine and Salt, and when they are dead, to take them out and to cleanse them. This powder with the juice of Marigolds, wilt cure the Eulep's; with Mead, the Droffe; with white Wine and Myrhe of the Trogodytes, the Jaundie; with boiled Wine, Hydromel, or Wine, the Stone, the Ulcers of the reins and bladder; you may give a draine weight. In three cya-th of water they will break inward Impol muted, and bring them forth, if seven or nine of them be brought into powder. They fly alfo the Dynanche, help Baremenes, bring forth the Second one that slays behind, ease the pains of the Hip-gowt, open the Liver, cure Tertian Agues, kill and drive out all Belly-worms, given in liquors or decoctions that are proper for it. Also the decoction of Earth-worms drinked with the juice of Knot-grass or Comfreyn, is good against continual pilling, especially if it be alfo call'd in by a Clyfer. Also a Clyfer of their decoction easheth the Emews wonderfully. Some, where they infect clostel blood, give the decoction of Earth-worms to drink with great faccets. For the diseases of the Fars almost pist cure, boyl them in Goose-grease and pour that in. Boyled in oyl for the Tooth-ach, and pourd into the ear on that fide the pain is, as Pliny faith, they give ease, or if you drop them into the contrary ear, as Discrepides faith. Thus far for Earth-worms given inwardly, from experience and testimony of Discrepides, Galen Antius, Aegintas, Myreplas, Pliny Valarius.

Also outwardly applied and bruited, they joyvn wounds and nerves in fnder, and heal them in seven daies; wherefore Democritus would have them kept in Honey. Their aches with old oyl, cleaneth corrupt Ulcres; and as Pliny writes, commen the hard edges of them, if it be mingled with liquid Pitch and Simnhick Honey, Discrepides faith Sicilian Honey is called Simnhick. A certain Chirugion now in England of good note, makes a liniment of Earth-worms and Ho ney, whereby he annoints the tent, and imprinkles it with fine powdred Allum, and puts it into a Fiilula, and fo brings forth the core eaten out with no pain, and heals the wound. Also their ayes draws forth things that tick within, and laid on with oyl of Roses cures Kibe-heals, Marcellus.

Severus faith, that when the nerves are cut in fnder, it is good to lay on Earth-worms bruited with Hogs-grease that is old and rank. Marcellus Empiricus adds Grondiel to the Hogs-grease and Earth-worms, with the render tops of Box with Frankince, and this he lays on the nerves cut or pain'd: Pliny faith that the ayes of these and of a wilde Moute, laid on for a platter, with oyl of Roses, is excellent for broken bones.

For the great pains of Horfes in their nerves or joynts, to help them, Ruffius, Abhyrus, Didymus, collect a great number of Earth-worms: whence Cardus gathers that they will eafe all pains. Mendella affirms that contradiction of the nerves will be cured if you annoint them with oyl of Camomil that is well replennishd with Worms, Marcellus faith that the fame is done with Honey and Worms, as before. Antius faith, without doubt they are an excellent remedy for the Gove boiled in oyl and a little wax: so faith Marcellus, but he sometimes mingles Honey with them. Vigo for pains in the joynts, makes a platter of these and Frogs, to which he adds Vipers-grease.

For pains of the joynts: Take joyvn of Worms it, oozes, oyl of Roses, or Ores, what ma
**Chapter 29. Of lesser living Creatures.**

Suffice, mingle them to an ointment. Another that is singular. Take the marrow of a Calis leg compleat, and old yel of Roses, ounces, Earth-worms cleansed with Wine and Salt ij. ounces, let them boil in Balneo to the constellency of a Muclage; with this anoint the neck, shoulders, and the places where the pain is, for it gives great help. Pliny. Marcellus anoints them with Honey, and then he laies on the Mucilage prepared. When any part is waited and receives no nutriments, cleansed Worms must be put into a glas very well luted, that nothing may breathe forth, and so set in a warm oven or in Balneo, and they will then resolve into a clammy moisture; an admirable remedy and approved for the Palsy of the limbs: Take the ashes of tender Earth-worms iiij. pounds, Ginger, Galanga, of each iij. ounces, with clarified Honey incorporate them for an Unquiet, with this for three nights together anoint the Patient, binding his arms forcibly over his belly or stomack, then cover him warm, and let him beware of cold. *Jacobus de parma.* To drive away hoary hairs, women use these ashes mingled with yel while it they comb their head, as Pliny faith, to whom Serenus subscribes in these veris:

> Earth-worms and yel of Olives, free from cares,  
> They will preserve a man from hoary hairs.

We said before how they cure the Tooth-ache. But further the powder of them rubb'd do will preserve the sound teeth, and being injected will make rotten teeth, though it be a grinder, to fall forth; especially, if the tooth be first scarified, and fill'd with powder well sprinkled on it. *Aetius.*

*Gal. 5. s. loc.* bids us do almost the fame out of *Archigenes.* Also they are good with the root of Mulberries boiled in Vinegar of Squills, to wash the teeth. For purulent Ears, poured in with yel they help much, as *Galen* thinks, and cure their inflammations, being boiled with yel of Roses. *Aetius.*

If that your bearing fail, an old disease,  
Is cure'd with Earth-worms boiled with Ducks' grease. *Serenus.*

Myrsfus bruseth Worms with some small quantity of the earth from whence they were taken, and works them together, and anoint that upon ears that are bruised. Marcellus bruseth them with yel of Roses, *Celsus* with yel of Olives. *Faventius* for pains of the ears anointeth the outward parts with yel of Earth-worms, and also pours it into the inward parts. Marcellus bids to bruise Leeks not planted but fowed, odd in number, and as many Worms together, and boil these in the belt Oyl to thirds, and he faith that this yel put into the ears is very good for their greatest pains and deafness. *Athenor* cures clefts of the hands and feet with yel of Earth-worms. For an old pain of the head, they are held very excellent bruised with Vinegar, Frankincense, and Castoreum. *Galen* for the same prepares in his *Eupraxis* such a Remedy: Take xv. Earth-worms, as many grains of Pepper, Vinegar what is sufficient, mingle them, smeer them on. Another: Take Earth-worms, Moufe-dung, white Pepper, Myrrhe, each half an ounce, bruise and mingle them with Vinegar, and anoint that part of the head that the pain lies on. *Myrsfus* will have the Worms to be odd, and to be taken only with the left hand, and so superstitiously anointed. If thou wouldst try, faith Marcellus, whether a swelling in thy neck be the Kings-evil, lay a live Worm upon every dwelling; if it will cure any where, this Worm will turn to earth; if not, he will be alive and receive no hurt: so faith Pliny also. Earth-worms are a part of that noble Plaister of *Arnoldus* (*a Breviorius*) of a Rams skin, or the bloud of a man that is red, against the Rupture: and *Hollarium* commends it to cure *Entomoele* and *Eppholoe.* They also diminish the Stone, both taken inwardly, as also anointed on the thare somewhat thick. *Gal.* What concerns women diseases, bound to the neck they retain the birth, but contrarily applied to the hips, they draw the birth out and the secondone, for they draw mightily whereover they are applied living. In inflammations of the breasts, Earth-worms alone laid on will cure, for they concoct, open, draw forth, and heal Alex. *Benedict.* So *Myrsfus* makes a plaister of them bruised. Lay on Earth-worms with Quinces, or with dried Barley flour, upon Breasts harden'd or inflamed. *Aetius.* But if after delivery women breasts swell, and to use the words of *Serenus*:

> If the swoln breasts do feel great pain,  
> Smear them with Earth-worms 'twill help them again.

For they will concoct the Impofumes and inflammations of the breasts, and after concoction will heal them and void out the matter. For the Shingles, the Indians, faith *Carus* *Clusius,* make an unguent thus: Take Earth-worms, and feed them some time with leaves, fine flour, or flour and milk, and when they are grown fat, boil them in an earthen vessel (always scumming them) when they are strained, boil them again to the constellency almost of a plaister, which well prepared will be almost of a yellow colour; dissoile some part of this in distilled water of Roses, and wash the part affected with it twice a day. A most excellent remedy, faith Clusius, and proved by very long experience. *Pliny* faith they will do the same in Vinegar, who together with *Aetius* and *Myrsfus,* affirms that Worms bruised and laid on the place a Scorpion hath stung, are admirable remedy, for they presently ease the pain, and correct the malignity of the tumour.
Of Earth-worms is known by all to be good against divers infirmities, and the Ancients made it thus. Take Earth worms half a pound, Oyl or Roses, Osphane, two pound, the best white wine two ounces, let them boy in bain'to till the wine be consumed. This cures the nerves relaxed, contracted, almonished, cut in funder, or crooked, it eateh almost all pains, and wash the throat, being anointed on the face and loins. But in the preparing of it, every man follows his own opinion. For some before they adde Oyl, washe and purge them with white wine, some neither wash them nor press out the earth, and perswade to take the white wine, that it may penetrate the sooner: Others use simple Oyl, not Oyl of Roses, others again Oyl of Chamomile. Alfo they shew us many ways to boil them, for one ueth a furnace, another Balthume, another doth it in dung, and some mingle of Chamomile flowers, and of Dill, to affwage pains, some of Hypericon flowers to glee wounds together, others Snails without shells, others with shells, every one as he thinks fit. The Author of Barapalia preparres an admirable water of Worms, fol. 25.4, that is very good for wounds and disease both outward and inward. For Worms of Heres and Oxen. Pelagonius puts live Earth-worms into their nostrils, yet it were far better with a horn to put them down their throats into their stomacks. Tartarius bids give ashes of Earth-worms bruised with feth. to a Hawk, when the cannot mutre. They are also most for Moles, and when they dig, they will break out of the earth in wonderfull halfe. Sows (as Verto writes) will trouble the mud, and dig up the earth with their mouts to feed on them. Albertus faith that Toads, Bellonius Lizards, Tarentinus that Sea Grampers, and experience faith, that Frogs, Eels, Gudgeons, Carp, Roche, Trouts, Darce, and Tenches will greedily devour Earth-worms. Alfo that bird Aristotel calls Αἴγ, some call it Vangellus, and Hens, and all Quails will feed on Worms. But if there be no wife Fisher-men, that caufe Worms to come forth with medicinal juices, for when they are bitter the Fith will not bite, but if they lie a day in Wheat-meal and a little Honey, and then put upon the hooks, they relish better then Ambrosia: And it is no ordinary good we may receve by them, that they forefrewh rain when they suddently come forth of the earth, but if they lie hid the night before, it is a sign of fair weather. Some do make Iron like Steel thus. Take Earth-worms two parts, Radish-roots one part, bruife them, and dillfull the water in a Limbeck. Or take dillfulld water of Earth-worms three pound, juice of Radithes one pound, mingle them, let Iron hot be often quenched in this water, and lie in it ten days, and it will grow very hard. Aanother. Take Earth-worms two pound, juice of Radith one pound, dillfull them at an easie fire, and temper your Iron with this dillfulld water. Alfo draw forth juice of Sorrel, finking Hemlock, and of round Arifolochia, of each alike, and temper your Steel often. The juice of Sow-bread is thought to do the fame. Mr. Fakenbam a famous Phylisten writes thus. Aanother. Take Goats blood, add to it a little salt, let glased pots be buryed in the earth, well luted for thirty days, then dillfull the bloud in Baines, and put as much of the dillfulld water to the fame quantity of the water of Worms. Aanother. Take water of Worms, Rapes, roots of Apple-trees, each alike, dillfull them apart, and mingle equal quantities together, and quench your Iron in that water, as we faid before. A Frenchman nameffje.

Chap. XXX.

Of Worms in living Creatures.

Tadnau thinks they are called Lumbreci from Lumbi the loins. For the Ancients call the belly Lumbos and parysides by Heftobius, and Sudias. Some interpret that, those that are sick of Worms. But more rightly from Earth-worms, they reepreffe in form and nature, doe they borrow that name. Cornellius Celsus calls them Worms, Pliny the living Creatures of the en-trails. The Greekes call them Ψαλίσματα, Σπελεία, Στρατήγοι, and when they are extraordinary great, ζωή, as appears out of Ellen, l. 9. c. 33. You must observe, that Latin writers make difference between Vermes and Vermina or Vermintionem, that is Worms, and difeases from Worms in the belly; for Vermina and Verminatio, are the pains of the belly from Worms, as Cels, Sera, Celsus, Pliny, and Seneca Epif. 97. tellus the Arabianjs call them Emaric, Sulplicantus Elin- ger, the Germans Spulourm, Backhorm, the English Gutworm, the Sclavonians Stirkawks, a word hard to be pronounced. A belly-worm is a living Infect, without feet, bred in the bodies of living Creatures, hurting their operations diversly. I fay, a living Creature, that I might exclude thoSE broad Worms called Tenite, which though they be of substance that grows to the guts, and are in form like to living Creatures, yet they cannot properly be accounted living Creatures, as Hippocrates 1. de morbis, rightly affirmes. I fay an Infect, both because they are of a round body, and because the Ancients do not reckon them amongst Serpents, nor have hitherto ranged them into any proper Classis. I fay without feet, that I might diftinguifh them from Worms with feet. I fay bred in the bodies of living Creatures, because they are not only bred in the guts of living Creatures, but in all the fleshy parts, and in the heart it felf, as it shall appear by the history. And not only men are troubled with them; but alfo Horses, Calves, Dogs, Hogs, Hawks, and all perfect Creatures. I fay that diversely hurts actions, because from them, pains, Confumptions, Convulfions, Epi-lepsies, Frenifes, and divers other mischies follow, especially if they be very great, or very many. And
And all these Worms breed either in parts that are alive or dead. The worms in living Creatures seem to be of three sorts, the round Worms, Guard-like Worms, and Aff a fly, such as are bred often in the Intestines of living Creatures: And not there only, but in other veins and bowels; of which matter I find there was a great controversy amongst the old Authors. For Galen & c. de i.e. aff e. s. assigns certain diseases to certain parts, as worms to the guts, the Stone to the veins and bladder. But I myself with many other persons of the University, saw a stone as great and like a Pigeon's egg, voided by a fool, at Cambridge, by Dr. Larkin the King's profector in physics, who was long tormented with a pain of the Colick, and standing, and he voided that stone in the same form and magnitude, as a most troubleome birth at his fundament. Anastas and Benemienius write that they saw the like. Also by giving but one Clyfter to the choie wife of noble Le- nomai, I brought forth 2 stones like to Medlar seeds, at one time in the year 1595. Many there are that question the credit of Pedemontian Acculamn, Muscinum, Troll aura, Benemieni, and Abbianus, because (besides the opinion of Galen) they have written that they have more then once seen stones in the head, hungs, greater veins, the gall, bladder, under the tongue, in the jouynts, and belly. But since daily experience doth clear them from a lie, we may say that the Greek speake, as Greeks were wont to doe, but that these men speake but the truth. Galen might have remembered, that Hippocrate, Epil. 5. fec. 12. did not rashly affirm, that there was a thirp stone prefixed out of a women's matrix, by the hand of the Murther, as great as the whirle of a Spindel. Thus I thought fit to premise, lest when I should report them, the faith of others and my own experience that worms are bred almost in every part, others should think I relate either a thing very strange, or what is false. Worms seldom appear in the most vehement pain of the Humerus, yet Helleothes teacheth that it so comes to passe at some times, l. i.e. 1. The Pelonians call this disease Sunny Roback, the Germans Hauswurm, and it was formerly frequent in Germany and Hungary, and all that were taken with it fell into the frenzie, or madness, and when they were dead, and their brains opened, a Worm was found there. Then the Physicians gave Garlick with distilled wine once or twice a day, and all that drank of that recovered, the rett dyed. A Phis Shot cured five of his servants that were sick of that disease, with the same remedy, as one writes in a Letter to Gaffur. That Worms are often seen in the brain, Thomas a Viga, faith, som cap. 5. i.e. lae. fec. eff Galen, et Batifas Conidian c. 10. de f b. Hungar. Also Cornelian Gaffuri, in Appendices, spec. Cornubicet, disputing of a pellentiel Semeterian, speaks of a woman in a city near the river Motz, that had a long and vehement pain in her head, when the was dead of it her brain was opened, and there was found a great quantity of filth, and abundance of Worms. That disease is known faith Robus, by the internall corroding of the forpart of the head, and by the most vehement pain, that almost makes them mad. It is cured by neckles, and juices call'd up into the nostrils, that will kill Worms. Robus, l. i.e. 9. But the Worms that are yearly found in the brains of Stags, and sometimes of Goats, Sheep, Rams, (chiefly those that are fat) that Hunters and Butchers know better, than that I need to tell them. They are as big as the greatest Worms, and of the same form with them, as Alexander B. medicius and Matthijs report. Theophrastus mentions thes Hipp. l. i.e. 53, and Alexander Trithemius, l. i.e. 15. It is reported that B. medicus of Athens, when he was young was troubled with the Falling sickniffe, and he went to ask counsell of the Oracle of Apollo, and Apollo answered him thus:

Take a tame Goat that hath the greatest head,
Or else a wide Goat in the field that's bred,
And in his forehead a great Worm you'll finde,
This eases of that kind.

The young man was much troubled at this answer, and he repaired to Theogstus Democritus, that was then ninety years old, to tell him the meaning of the Oracle. This Theogstus told him that nothing could be plainer, for he had learned by long experience, that there were Worms in the heads of Sheep and of Goats, that being wrapt in a black Sheeps skin, and hanged about one neck, would miraculous cure the Falling sickniffe. Some write, as Fines witnesseth, that two Worms are found in the head of a downy Pelahangum, which Worms bound up in a Deers skin, and bound to a woman before the Sun rising, would hinder conception. Concerning Worms of the Abdomen. A woman, faith Pennius, that I knew very well, told me that she had seen more than once, some round Worms, that crept forth by the belly by the Navel.

The Ancients also say, that oft-times Worms will breed in the ears, against which they prescribe these remedies. Take the juice of wide Cucumbers, and the juice of Garden-sage, or that with broad leaves, mingle them both alike, and pour that into the ears. Gal. l. 3. fec. loc. where reckoning up the Compositions of Aduromadin for the ears, he highly commendeth this of Pistis and Hippocolo. Take Opium two oboli, Myrrhe, Spikenard, Saffron, of each three oboli, burnt brasse five oboli, and of round and Stell Alum, each one dram, black Heilcobore two drams, mingle them with sod wine or Ofyl of Roce, and apply them to the ears. Lib. Eup. 2. he writes, that a Locut inflall will destroy Worms in the ear, and he bids apply a sweet Apple to the ear, with a hole in it almost quite through, for the Worm will come forth, excused by the sweet smell of it. Finy much commendeth the root of Cypresse boil'd in water, and the urine of a young boy, and the juice of Hemp, Rse, Bramble, and of Capers powered in. Lastly, many remedie may be fethce from Bbb b 2

Columella,
Colomella, Vegetius, Marcellus Empiricus, Tradissius, Vigo, Tardatus, and all the Arabians, and therefore here I suppose, paffing on to other matters. Monardus prescrib’d to one that had a Poly-pus in his nose, the juice of Tobacco to be injected; whereby the Uter was purged, and many little Worms came forth: Wherefore they breed all in the nostrils, (for all the Arguments that Colomella hath alleaged against it) and are not only cast forth of other parts. Cow-heards know that Worms will breed under the tongue, and the Worm under a Dogs tongue (the carrying of which Worm about one, faith Pliny, will drive off the biting of a mad Dog) doth prove that sufficiently: And Valerius faith he hath seen Worms under mens tongues. It is known sufficiently by experience, that the very Breast and Lungs are not free from Worms; Antonius Boerovinius, Benedicus Renius, Mandella, Antonius Stiusus, are my witneffes, who have seen them cast up, not by vomit or reching, but even by coughing. Alfo Alfaranius, Capite de Tuff, writes, that sometimes a cough is caufed from living Creatures bred in the hollow of the lungs, and cavity of the breast, which being no greater than little Luft-brings, yet when they creep from place to place they make one cough, and when they lie flill it ceafes. Alfo Abdomus Athenaeum, lib. l. tref. t. c. 3. makes mention of them, affirming that the old Physicians faw and wrote of them. Allerus and Gratius faw fome in the liver and spleen, and Platus in the gall bladder. Wherefore, whatever Golen or Avicenna may fay to overthrow this from the perpetual motion of the Lungs, the nearnefs of the heart, and other frivolous Arguments, yet there is no man but will fay, but that reafon muft give place to fence, especi, naturally in things. There was faith Hieronymus Gabouin, a certain Noble woman of Feines (in his Comment of Worms, to which we are indebted for the great part of this History) when he had a long time been torment’d with pain of her stomack, at laft the call’d up a ball of hard flegme, this being diffigect, it seemed like a piece of ftefh, and in that there was a Worm, and thus the woman recovered, whom the neighbours thought to be bewitched. Of Worms the Reins and Bladders, When the reins pufrefe, or the muscle of the bladder, fo-times little Worms are caft out, concerning which I thought good to write these histories out of Femina. A woman thirty six years old, had grea? pain of an Apoftheme in her reins, and the confumed, at length the caft forth little Worms, a fingers breadth long, which I firft saw in the bottom of her urine, Adobe 1587. Randulp a London Physicin, very learned and pious, when he looked on at the defection of the body of one that was dead of the Stone in the kidneys, he found in one of the kidneys that wasm corrupted, it was wrinkled and purfuted, a Worm of a full length. Timothy Bright, a very skilful Ckeck of Queen Mich. Mark that call’d out a Scolependra by her nostrils, &c. Mr. Grant.

Of the Description of Worms in the Intestines.

Vwee fhewed before that there are three forts of Worms that are bred in the guts. It will be worth our labour to describe what each of them is. The round Worms are the firft difference, and that manifest to all men, because these are the most common, and are fo called, because they are indeed round and smooth, not unlike to those worms that breed in dunghills and gardens, which we faid before are called by the
And all these Worms breed either in parts that are alive or dead. The worms in living Creatures seem to be of three sorts, the small Worms, Guard-like Worms, and As a 4rd, such as are bred often in the intestines of living Creatures. And not there only, but in other vessels and bowels; of which matter I find there was a great controversy amongst the old Authors. For Galen 1. de loc. aff. 9. alius, certain diseases to certain parts, as worms to the guts, the Stone to the reins and bladder. But I shall say with many other persons of the University, saw a bone as great and like a Pigeons Egg, voided by Foul, as Cambridge, by Dr. Larkis the Kings professer in physicke, who was long tormented with a pain of the Colic, and wailing, and he voided that bone in the same form and magnitude, as a molt troublesome birth at his fundament. Montanus and Benvenentius write that they saw the like. Also by giving but one Cyster to the choise wife of noble Leosentius, I brought forth 55 flones like to Medlar seeds, at one time in the year 1583. Many there are that question the credit of Pedemonum Arculumus, Guamshi, Trall amus, Benvenentius, and Montanus, becaufe (besides the opinion of Galen) they have written that they have more then once seen flones in the head, lungs, greater veins, the gall, bladder, under the tongue, in the joyes, and belly. But since daily experience doth cerne them from a lie, we may say that the Greek speak, as Grecly were wont to doe, but that these men speake but the truth. Galen might have remembred, that Hippocrates, Epul. 5. fce. 12. did not rashly affirm, that there was a sharp bone preffed out of a womanes matrix, by the hand of the Mowife, as great as the whistle of a Spindle. This I thought fit to premisse, lest when I shall report them, the faith of others and my own experience that worms are bred almost in every part, others should think I relate either a thing very strange, or what is false. Worms seldom appear in the molt vehement pain of the Hemorrhia, yet Hippocrates teacheth it that it doth come to paffe sometymes, l. c. 1. The Pamant call this disease Nymwy Rohac, the Germans Hauptwurm, and it was formerly frequent in Germany and Hungarie, and all that were taken with itfell into the frenzie, or madnede, and when they were dead, and their brains were opened, a Worm was found there. Then the Pluyfians gave Garlick with distilled wine once or twice a day, and all that drank of that recovered, the rett dyed. Thib paulcurng five of his fellows, that were sick of that disease, with the same remedy, as one writer in a Letter to Gepuer. That Worms are often found in the brain, Thauum a Vaga feth, com in cap. 5. de loc. fce. Galen, and Bauffier Constantine c. 10. de f.b. Hungare. Alfo Cornelius Gramma, in Appedice spec. Gremcr, disputing of a pellamental Seminian, speaks of a woman in a citie near the river Me4, that had a long and vehement pain in her head, when she was dead of it her brain was opened, and there was found a great quantity of filth, and abundance of Worms. That disease is known fith Rhefris, by the internal corroding of the forepart of the head, and by the most vehement pain, that almost makes them mad. It is cured by neefings, and juices call up into the nostrils, that will kill Worms. Rhaphis, l. c. 9. But the Worms that are yearly found in the brains of Stags, and sometymes of Goats, Sheep, Rams, (briefly those that are far) that Hunters and Butchers know better than that I need to tell them. They are as big as the greatlest Worms, and of the same form with them, as Alexander B. meditius, and Mathebourn report. Theophratus mentions thefe Hift. ub o. 53. and Alexander Trallianus, l. c. 15. It is reported that D. merus of Athenes, when he was young was troubled with the Falling sicknesse, and he went to ask counsell of the Oracle of Apollo, and Apollo anwered him thus:

Take a tame Goat that hath the greatlest head, Or else a wide Goat in the field that's breed, And in his forehead a great Worm you'll finde, This cures all ickneses of that kind.

The young man was much troubled at this answere, and he repaired to Theognisias Democritum, that was then ninety yrs old, to tell him the meaning of the Oracle. This Theognisias told him that nothing could be plainer, for he had learned by long experience, that there were Worms in the heads of Shepp and of Goats, that being wrapt in a black Sheeps skin, and hanged about ones neck, would miraculously cure the Falling sicknesse. Some write, as Pliny witnesseth, that two Worms are found in the head of a downy Phalamion, which Worms bound up in a Deers skin, and bound a woman to the Sun Rising, would hinder conception. Concerning Worms of the Albemone. A woman, faid Pliny, that I knew very well, told me that she had seen more than once, some round Worms, that eecpt forth of the belly by the Navel.

The Ancients also say, that oft-times Worms will breed in the ears, against which they prescribe the following remes. Take the juice of wilde Cucumbers, and the juice of Garden-sage, or that with broad leaves, mingle them both alike, and pour that into the ears. Gal. l. 3. fec. loc. where reckoning up the Compositions of Aspermacbus for the ears, he highly commends this of Putrus and Hapsium. Take Opum two oboli, Myrrhe, Spikenard, Saffron, of each three oboli, burnt braffe five oboli, and of round and Steil Alum, each one dram, black Hellebor two drams, mingle them with sod wine or Oyl of Roifes, and apply them to the ears. Lib. Epurit. 2. he write, that a Locust will destroy Worms in the ca.5, and he bids apply a sweet Apple to the ear, with a hole in it almost quite through the root of Cyprus boyled in water, and the urine of a young boy, and the juice of Hemp, Rue, Bramble, and of Capers powred in. Lastly, many remedies may be fetcht from

Columella.
Chap. XXXI.

Of the Description of Worms in the Intestines.

WVEE shewed before there are three sorts of Worms that are bred in the guts. It will be worth our labour to describe what each of them is. The round Worms are the first difference, and that manifest to all men, because these are the most common, and are so called, because they are indeed round and smooth, not unlike to those worms that breed in dung-hills and gardens, which we said before are called by the

Columella, Vegetius, Marcellus Empiricus, Tarrabius, Vign, Tardanus, and all the Arabians, and therefore here Huperfede, passing on to other matters. Mortainus prescribed to one that had a Poly-pus in his note, the juice of tocobac to be injected, whereby the Uter was purged, and many little Worms came forth: Wherefore they breed also in the nostrils, (for all the Arguments that Gabucius hath allledged against it) and are not only cast forth of other parts. Conswards know that Worms will breed under the tongue, and the Worm under a Dogs tongue (the carrying of which Worm about one, faith Piny, will drive off the biting of a mad Dog) doth prove that sufficiently: And Valenfae faith he hath seen Worms under mens tongues. It is known sufficiently by experience, that the very Breath and Lungs are not free from Worms; Antonio Benevenius, Benedatuus Renius, Munduella, Antonius Sivius, are my witniesse, who have seen them cast up, not by vomit or reaching, but even by coughing. Alfo Afluarius, Capite de Toff, writes, that sometimes a cough is cauof from living Creatures bred in the hollow of the lungs, and cavity of the breath, which being no greater than little Lute-stringgs, yet when they creep from place to place they make one cough, and when they lie still it ceateth. Alfo Abenwarm Abhemorae. lib. 1. tred. 1. c. 3. makes mention of them, af- firming that the old Phyficians faw and writ of them. Albertus and Gentilis faw fome in the liver and spleen, and Plateus in the gall bladder. Wherefore, whatever Galen or Avicenna may faie to overthrow this from the perpetual motion of the Lungs, the neerefes of the heart, and other frivo- lous Arguments, yet there is no man but will faie, but that reafon must give place to fenfe, especia- lly in natural things. There was faith Hieronymus Gabucius, a certain Noble woman of Fener (in his Comment of Worms, to which we are indebred for the great part of this history) when she had a long time been tormented with pain of her foftomach, all at the fife up a ball of hard flegme, this being diffefted, it femeed like a piece of fheef, and in that there was a Worm, and thus the woman recovered, whom the neighbours thought to be bewitched. Of Worms of the Reins and Bladders. When the reins putrefie, or the muscle of the bladder, oft-times little Worms are cast out, concerning which I thought good to write these histories out of Fenuius. A woman thirty fix years old, had great pain of an Apotleme in her reinf, and the confirmed, at length the calf forth little Worms, a fingers breadth long, which I firft faw in the bottom of her urine, Aino 1582. Randolph a London Phyfician, very learned and pious, when he looked on at the diffeftion of the body of one that was dead of the Stone in the kidneys, he found in one of the kidneys that was corruptd, it was wrinkled and putrefied, a Worm of a full length. Timothy Bright, a very skillful Phyfician, and to whom we are much indebted for the Epitome of the Ecclefiafical History, faw a Scholar at Cambridge when he lived there, that pilfed out a Worm an inch and half long; but it was not without feet as Worms are, but it had many feet and was very nimble. Alysius renardus Medecinae Digest. 4. Argrentites de ufe. mor. Randulfofum ib. de aegro morb. c. 17. Scholaitas Health lib. de morb. int. cap. de ufe. twt. (to fay nothing of Levius Cardia, and my own experience) do suf- ficiently teftifie that fuch Creatures breed also in the bladder: That Worms come forth of the matrix, like to Alcarides, I did not only fee at Frankfurt in a German woman, at eighty years of her age, but Alysius confirms the fame in his Epifle to Cijer, and Hippocrates. 2. de m. mulier. and Avenwar, lib. 1. tred. 2. have faid the like. Kirvait writes, that there is a Worm to be found in the matrix of a Male, which tied to a woman will make her barren. In India and the Countrays above Egypt there are fome living Creatures like to Worms in form, (they are commonly called Dragons) they are in the Arms, Legs, Shanks, and other brawny parts, also in young children, they breed in secret places under their skin, and more apparently: When they have flayed there for some long time, at fome end of this Dragon the place comes to putrefie, and the skin being open, out comes this Dragons head. Paullus ib. 4. c. 59. Suerius granteth this, but he queftions whether they be living creatures. Moreover, in the bloud it felfeome living creatures breed, like to Worms, that feed to the body, as Pliny writes, Hift. 26. c. 13. Plutarch. 8. Symph. who writes, that a young man of Aibus voded Worms with his feed. Ancira faw them come forth at the groins and buttocks, as he faith ib. 4. to whom Benevenius subcribes c. 100. Alfo they breed un- der Sheeps claves, (faith Columella) and fuch I have seen under the nails of those that were troubled with a Whit-faw. And thofe fure concerning Worms in the bodies of living Creatures. But fuch as breed in dead and corrupt bodies, (whether it be from the disease or the Chirurgeons fault) want a Latin name, but the Greeks call them Elythus, as appears by Hippocrates. The English call them Maggot. Callus would also have them called Eulinn in Latin, borrowing the word from the Greeks, We will speak of thefe in order. And first concerning Worms of the guts, the defcriptions whereof, the caufes, Signes, Symptoms and cure will bring much light to the History of therell.
the Greeks, the bowels of the earth. Thence as all other Worms are blind, without any eyes, and they are a hand length or something more: yet Benninumius, c. 2, affirms that a Smith did vomit up a Worm with groffe flegm, almost a foot and half long, very plain, with a red head that was smooth; and about the bignefs of a peafe; but the body of it was downy, and the tail crooked like the half-moon. Also at Rome, anno 1543, one that was now upon his youthful years, when as for many daies (as Gabucius tells the story) he had been in great torments of his belly, at laft he voided by ftool a great black Worm with black hair, five feet long, as big as a cane. He saw one also that did not exceed the hands length, like to the round Worms, but that the back of it was hairy, and fet as it were with red hairs; but this being call forth by uſing good remedies, he grew very well. One Antoninus a Canon (as Hiftoriusii Montanus tells the story) voided a green Worm, but he died shortly after he had voided that. But for the most part they are smooth and not hairy, a hand long and not a foot, at both ends pointed, as it were with a nib. And they differ fo far from Earth-Worms, that they wear no collar nor girdle: what concerns their colours, I have seen fome red, yellow, black, and partly white, or gold colour. Green ones are seldom seen, yet Montanus saw fome. Gourd-worms are thofe quick Worms that are like unto Gourd-feeds; concerning which the quefion is fo great between Gabucius and Mercurius; for when he treats of a broad V Worm, that is made of an infinite number of Gourd-feeds shut up in a skin; he faith thus: I, faith he, think a broad Worm to be nothing else bar, according to Hipparates, as it were a white faving of the guts, that comprehends all the integuments, between which fome living creatures are bred like unto Gourd-feeds: which may then be fecn when all that is faving is voided, yet oftentimes it is voided by parts: which if they break when they are voiding, then you may behold these Worms like to Cucumer-feeds voided by themselves, fometimes many of them being folded together, fometimes but a few. But if any man fhall fee all that portion, let him know, that that feaping off like a Worm doth not live, but the creatures that are in it, like Cucumer-feeds. I once faw this Worm called a Broad Worm that pafs, to have been of a wonderful length, and it crawled, a woman in a quotidiam Feaver voided it by fpoile, and when I did with admiration much view it, and fought to finde the cause of its motion: that other man, who faid he voided a portion of a broad Worm three daies before, which he would fowe unto me for a wonder, did fhow me with incredible defire I had to fee it; for this portion did move it felf, whence I was more defirous to know the cause of that. At laft feeving diligently, I obferved through the whole hollow part of it, a rank of living creatures like to Cucumer-feeds, which crept for of them as our worms do, fometimes one, fometimes two folded together, oftentimes four, or more, and that part of the faving of the guts that was empty of these creatures did not move at all, but fank down: whence it comes to passe that I think a broad Worm nothing else but fnofty matter bred betwixt the guts, or fqeunely flegm thickened by the coldneffe of the guts, covering the inside of the guts like a coat, which women that afflict the fick call a bed of Worms. Out of which fnofty matter little living creatures like Gourd-feeds proceed, as by way of a conception, which is covered all over by the second membrane in the womb which is first made of the feed. So faith Gabucius. Aquinnia agrees in this opinion, Fen. 16. trafl. 5. cap. 2. the Gourd and broad Worms are bred from the clammy matter that is fiftled in the superficies of the guts, which is comprehended by a flegmatrick pannick covering it as if they were bred from that, and did putrefie within it. Antonius Benninumius a Florentine fays the fame, and more clearly, in com. de mirand. mort. coxif, c. 87. who writes that in the mineral Baths at Aqquinus, that are in the Countrey of the Sennets, he faw a woman that for feven daies together drinking the water, did void thofe Gourd-worms in abundance, that ftook to fett together, one being clofe to the other, that they were in a rank in that was above four cubits long, yet you would judge them to be but one body and one Worm. Johnnes a Bookbinder at Bajil (whileft I studied Phyffeke there in that Acadamy, under Zangereus and Platerus my Matters, anno 1579) voided fuch a Worm ten ells in length without any pain, and not many years before he had voided the like. It confifted of many Gourd Worms; without which it had had no motion nor feeling, and might deferiously have been rejected from the number of living creatures. Platerus had fuch a Worm dried that was eighteen ells long, I faw it. Pliny writes of a Worm a fick perfon voided, was three hundred foot long: wherefore whatsoever Mercurius objects to the contrary, leb. 3. demorb. puer. cap. 7. fince experience proves the thing, is without any firm ground. He faith it cannot be that any living creature can produce fo many young ones, as there appear like unto Gourd-feeds; then, that the guts are not large enough to receive fo many young ones. Thirdly, that this comes to passe by reason of the violent putting them forth that gives the form, because the young one being broken by coming forth, is divided into thofe many pieces like Gourd-feeds. And hence we may conclude that thofe are trifles that the Arabians fpeak of Gourd-worms, forasmuch as there are none fuch: What is that I hear, moft learned Jefus? that thou being gray headed, and taught by long experience, shouldft fo applaud thy own imagination, that thou shouldst dare to deny a thing obvius to fene, and plain to our eyes, and to Gabucius Benninumius, and the Arabians? Go to, No living creature can produce fo many young ones like Gourd-feeds: why not I pray? when as one maid that took phyffeke to kill Worms, as Gabucius affirms, voided 177 round Worms? To fay nothing of that Benninumius reporteth c. 87. of the incredible multitude of them: and he was a man to be believed. And what thou speakest of the capaciousneff of the place, if that be an argument, it is an error to be laughed at.
For the guts will contain not only as many as are in a Gourd, but the Gourd itself prepared, By thy last objection thou dost but mock, but canst not weaken the opinion of Avicekmanus and the Arabians: for as much as in bodies dissected, Gourd-worms have been seen wrapt up in a roll, wherefore they took not their Gourd-form from the violent voiding them at the fundament, or from the manner of putting them forth, as thou either inventest maliciously, or ignorantly believest. I conclude therefore with Gabacinus, that there are Gourd-worms, and the broad worm called Tenia, is not properly a Worm, nor yet a living creature, but something about the entrails like white flavings, as Hippocrates faith, that is filled with thefe Gourd-worms put in fashion of a coat of Mail. Acurides have their name from Acerin, because they bite and tickle very much, and so exercize the patients that are troubled with them: others derive them from Acuridea, which signifies to move. The Ancients called them Beasts-worms, because they were seldom found in men, but often in Horses, Dogs, Hens, and Oxen. And they were so seldom seen in men, that Hippocrates, and Celsus that followed him, either knew them not, or thought them not worth the mentioning, and so they said nothing of them; and yet they write at large of other Worms. They are like the round Worms, but ten times shorter, (for they are seldom above an inch long) and what length foreever they be, they are thicker at the end of the longanum, and the sphincter of the anus they are found, causing a vehement itching in those parts. Galen writes in Lib. de Ling. Hippocrates, that Gour an old man called Acurides long Worms: which difficulty Mercurialis easily opens, for we should read it, faith he, not vauspiex great, but vauspiex small. Moreover, though in consideration of their breadth and thickness they seem long; yet compared with round Worms, they may be called short. These and round Worms are of divers colours, as the matter they are bred of is, or in respect of the heat that concocts them; but Gourd-worms are alwaies the same: whence I should conclude that Gourd-worms breed only from flieg, but the rest from all humours and excrements. Acurides oft-times come forth in great numbers, and before they be voided they prick much.

CHAP. XXXII.

Of the Original of Worms in the guts.

Aristotle lib. 5. Generat. and Hippocrates before him, 4. morb. make the material cause of Worms to be dung. Orbisius l. 3. Aph. 30. and Montanus that followed him being his Master, thought that living creatures might breed in the guts of all kinds of humours: and Mercurialis, who thought they were deceived, was blinde himself at noon-day. But let us examine his Arguments: It is found; saith he, that they will not breed from blood, because blood never produces so much, that living creatures may breed from it: Alfo he affirms from the judgement of Alexander Sylvanus, that living creatures cannot breed in the veins. But experience cuts off the nerves of his first argument; and the Authority of Rhases, Lophaïs, and Pliny, overthrows the second. Alfo they cannot breed of a melancholy humour, because it is cold and dry; nor of yellow choler, because it is bitter, and such creatures are not fed by bitter things, but destroyed. For which opinion, though he urge Aristale, Hippocrates, Galen 4. simp. med. Egineta, lib. 8. c. 27. yet what is there more slender than the opinion of them? For Butchers know that in the mists of Sheep, which is the fountain of melancholy humour, and in the gall of Oxen, which is the receptacle of bitter choler, innumerable worms are oft-times found. And I see no reason why Worms may not breed from yellow choler, as well as in Wormwood; from melancholy as well as in felines, from blood as well as in fugar. But if they be not bred from them, whence have they that matter they breed of? The Physician of Pallas will answer, It remains therefore that they can breed only of raw flieg, which either aUeth from too great quantity of the beast meats for want of heat, or quantity of bad meats corrupt by deprivation: which opinion, though it well agree with Galen, Egineta, Asius, Arcentor, Avicekmanus, Columella, Celsus, Alexander, and chiefly with our Mercurialis, yet in my judgement Hippocrates is in the right, who thought that living creatures are bred in the little world, as well as they are in the great. Therefore as in the earth there are all kinds of humours, heat and spirit, that it may nourish living creatures that breed, & hath man all kinds of mischief that nourisbeth things that breed. Moreover, when as these living creatures do reprefent perfectly Earth-worms, no man in his wits will deny but that they have both the same original. What flieg is there in the earth? yet it breeds round Worms, and Gourd-fushioned, and Acurides, and all forts of Worms, and the warme and warme earth abounds with them, so far is it that they should breed only of raw and corrupt humours. Do we not alfo daily fee that Worms are voided by men that are in health? For I knew a woman of Flanders, that at Francfort on the Main, which from her youth till she was forty years old, did daily void some round Worms, without any impairing of her health, and the was never sick of them. I conclude therefore that from every raw humour of the body Worms may breed; and not only from crude or corrupted flieg. The formal cause depends from internal heat, which is weak, gentle, pleasing, and fit to breed living creatures; wherein that plattick force of Calendick Nature, (to use the word of Avicekmanus) doth make the colours by the degrees
Of lesser living Creatures.

Of the signs and cure of Worms out of Gabucinus.

Let us therefore shew the signs of Worms, beginning from those that are called round Worms; both because they do more frequently vex children, and because they produce more painful symptoms; of which Paulus writes thus: they that are troubled with round Worms, are cruelly torn in their bellies and guts; and they have a tickling cough that is troublesome, and somewhat reddish, some have a hickop, others when they sleep leap up, and rise without caufe; sometimes they cry out when they rise, and then they fall asleep again; their Arteries beat unequally, and they are sick of disorderly Feavers, which with coldness of the outward parts come thrice or four times in a day or a night without any reason for them. Children will eat in their sleep, and put forth their tongues, gnash their teeth, wink with their eyes, they will be very silent, and are angry with those that rowe them up, the balks of their cheeks, in a short time, are sometimes red, sometimes wan-coloured. If the Worms run up to the Stomach, they cause nauseating, nauseaing, and want of appetite; and if the sick are forced to eat, they scarce can swallow it, and if they swallow it down, they vomit it up again, they void many corruptions of meat by their bellies, and they are swoln like a drum, the rest of the body grows unreasonable lean, not by reason of hunger, but by immediate evacuations. These things happen when these creatures creep and gnaw in the belly. A feverish heat sends up ill vapours to the brain,
brain, that arise from putrid moisture collected in the stomach. So writes Paulus. But Attius out of Herodotus writes thus: Those that are troubled with Worms have a most cruel pain of their stomach and belly, and they have a little frequent tickling cough, and yet they spit up nothings: in their sleep they shiver, and rise preternaturally; some again put out their tongues and flout their eyes, and are silent, and cannot endure to be rowded, and cannot watch for weaknesses: some have their eyes bloodshed, their pulses unequal, obscur, deficient, and recurrent; some want an appetite, children while they fast, bite their tongues, and move their mouths as if they sucked, or eat meat. But these things are done for a short time, and by circuits. Moreover some children besides reason, rise with crying, and presently fall down again: some crawl their teeth, which it seems happens when the Worms fly, and gnaw their bellies and guts. And now it appears that some are come up into the stomach, and cause loathing, and bitings: oftentimes so by themselves they are call upward, but sometimes with some flogmatick humour. Some Infants neglect the motion, and are benummed, and like those that are in a swound, they sweat a cold thin humour, and most commonly they are wan-coloured: sometimes the face will be red, especially about the cheeks, but this colour again is changed into more than ordinary paleness. Others again like dotards speak strange words in their sleep, others change their places they lay on, full sleeping, and they are vexed, and turn from place to place: but very few of those do cry, for most of them are void of reason, and are silent. Alto they that are vexed with round Worms, loast their meat, and if they eat any thing, they call it up again, or loath it so much they can hardly swallow it: for they fall into Feavers with vehement cold in the outward parts: some have their bellies swoln like a drum. So faith Attius. But these are the marks he reckons from Hippocrates opinion: Worms in the belly are discovered by these marks: If they be sleepy, and the disease will not let them, and their outward parts be cold, and there be gnawing at their hearts, the urine troubled, and the tongue full of moisture; also they that have Worms in their stomach, are full of spittle; and if any little Worm comes forth they spit no more: therefore all those that have Worms in the mouth of their stomach, do commonly call them up all by vomit, but those that have belly Worms, vomit them by siege. But they all nauseate, and vomit up what they take in. They are like to those that are pricked, that have contractions all over their bodies, and move suddenly and confusedly, and they have torments and pains of their guts. Vapours carried to the head cause Vertigoes. Moreover the manner of diet that the party used will shew the generation of Worms, and all the rest. These are the signs of round Worms; but all these signs must not be sought for in every one, as Paulus faith; but some and the principal of them. I might joyne here many things out of our new writers, unless what they say, and more also were not to be found in Avicenna, whence they borrowed it.

**Signs of broad Worms.**

Paulus gives us these notes of broad Worms: sometimes they abound in those that have Feavers, and sometimes in those that have none. In Chronical diseases they breed, gnawing the stomach, and causing a greedy appetite. They eat the meat so fail, that we need more, and if it be not present, they bite shrewdly; the body growes lean and weak, and unequal. But the most certain sign is, that some bodies like Cucumber-seeds come forth with our excrements: so faith Paulus, and Attius doth not differ from him, but that he faith, that they gnaw the stomach continually, and cause an insatiable appetite, and that the meats eaten soon turn to excrements. That they are affected grow weak of body and sluggis, and are always hungry, for what is living in the guts, when it hath consumed the meat, feeds on the body; but this sign will not fail us, if some things like Cucumber-seeds come forth. The first Hesperides gives are thefe: He writes after this fashion: There is another kind of this, that comes forth like the white flavings of the guts; which have these marks: The party voids seed like Cucumber-seed, and when he is falling he is vexed, and spits much, his liver being affected, sometimes not; and sometimes when this vehemently affects his liver, it drops his speech, and he spits much, and after that it drops: and sometimes there is great pains in the guts, sometimes the shoulders ache, and then it stops again. Sometimes these are the signs of the broad Worms. He that is affected with this Worm, is almost always in health, but when he growes weak, he can hardly endure it, or be recovered. For this broad Worm takes some part of those things that go down into the stomach, and if care be taken it may be cured, but if not, the Worm will not come forth itself, nor doth it kill a man, but growes old with him, &c. Hesperides are alwayes about the botomme of the belly as we said, and there they cause a great itching almost continually, as Paulus and Attius have written; and sometimes, as it is reported, they will make one faint. For that is shewed by their name. For they moving alwayes do continually exercize a man and tire him out. They that are troubled with these, feel alwayes a heaviness about their Precordia and backes. The signs of these are chiefly taken from the filthy smelung of the excrements. That they have Worms their eyes at first shine, their cheeks are wan, in the night they have cold sweats, their mouth is pale, they start in their sleep, in the day they are more feverish, their tongues are dry, their breath commonly stinks, their face is pale, they nauseate and vomit often, they loast meat, they craft their teeth, especially in the night, they put forth their tongues (and they seem to eat) they are angry with those that awake them, they speak strange words, sometimes they are in a lethargy, and pick frares, and their heads ache, they cry out in their sleep, as the disease increaseth, their hearts beat exceedingely, their voice is interrupted, their arteries beat weakly, sometimes in the height of their pain, they are extended, and their mouth foames as in the Epileptick, their belly is swoln like a Tympy; some-
Of lesser living Creatures.

Sometimes the pains abate, and again there follow torments, and Colique pains, with a barren liquid flux of the belly, sometimes they are colitive, and the excrements are hard. These are the signs of Worms, now follow the Prognosticks. The Prognosticks are very necessary in all diseases to know, what will be the event, and to know the condition of the patient serves much for the cure, as Hippocrates, especially in his Prognosticks, hath abundantly shewed; who in the beginning of his book de pruent. Medico, hath delivered it: Especially foretelling here before the patient, things present, past, and to come, and what the sick have neglected, he is thought to understand the condition of the patient; and hence it is that men will better dare to trust the Physitian. But because it is difficult to foresee all this, unlesse we use some artificial conjecture (I call that an artificial conjecture, that comes very near the truth) and who can easily attain this, unlesse he have learned the things that belong to the art, and remember them, and hath with all diligence exercised himself in the practice of it? The things will be thus known. If a man suppose that there is any vital vertue, he must know the disposition of the patient in strength and weakness; and when he is perfect in these, he must study further to know all differences of diseases in the great nee, and manner of them, and then to learn the foreknowledge of the future state. And when he hath learned all these, then he must exercise himself both in comprehending the magnitude of the disease by exact conjecture, and the force of the patient, and how long they may last. Now practicel will help him much in the present, and before he hath diligently learned all these, it will no whit profit him to see sick people: wherefore they that professe physick, proceeding in this method, shall never undergo any disgrace, neither in curing, nor foretelling of future events, which they report some famous Phystianes have fallen into. Hence it may be collected why some Phystianes are more fortunate than others, and what a fraud there is to resemble aPhysitian more fortunate then another; how absurd it is, that is, Galen and Hippocrates have shewed; saying, that a Phystitian must be exercized in all these things in his minde, and he must be diligent, and prudent by nature, that comparing all together, he may get a gross summe of predictions, that shall be useful for himself and for his patient. For if the force of prediction, that always for the most part, what the Physitian foresees will come to passe, while the Physitian is perfect, and the sick doth not neglect his orders But becaue, as it is evident, a Phyitian by predictions may get immortality almost, so chiefly from those things that do belong to this affect, he shall win glory to himself, by telling the sick their condition, who for the most part are children, or ignorant what their disease is. Since therefore Prognosticks are chiefly necessary for this disease, I wil not fail to set down what the Ancients have written of this disease. Paulus a great follower of Galen, writes of these things to this purpose. Worms bred at the beginning of Feavers, have their subsistence from the corruption in the body, about the slate of the disease, from the malignity of the disease, about the declinings, they grow better. For Hippocrates, faith, it is good that round Worms come forth, when the disease comes to a Crisis. But Astius writes thus from the opinion of Herodotus a Phyitian. Worms bred in Feavers, and without, that differ one from the other in multitude, magnitude, colour, and time. For Worms bred at the beginning of a disease, have their being from the corruption that is in the body, about the vigour of it, from the malignity of the disease, about the declination, from the change to better, and they are soon also voided forth, Nature driving them to the outward parts, as the doth the rest of the excrements. But the greater ones are wretd at the lesser, many than few, red than white, living than dead. Our new writers adde to these; if round Worms are call forthe at the beginning of acute diseases, they thaw pellet diseases, but if dead ones be cast forth when the diseases decline, they are an ill sign also, however they appear both these times, it is bad. It may be because that Fever that follows Worms is always naught, because it continues the matter for Worms. It happens also that the Worms are cast out of the fire and grow hot by reason of a Fever, and so are wreth these together, and moved, that they so much the more affect and trouble those that have these Worms. They adde further, that it is proved by experience, that Worms are in the belly, if in the morning you sprinkle cold water on the mouth of children stomachs, for they will all gather to one place. Worms sprinkled with blood, to voided is ill, for they shew great hurt of the guts, to call Worms up by vomit is naught, for it fwi the stomach to be flushed with filthy humours. Frequent cold breathing of children, their bodies yet swelling, is deadly, for it shews they will die the next day. If the eyes of the sick are somewhat held together, and cannot be closed by the fingers of those that stand by, death is at hand. Some there are, it may be following the opinion of Alfarasius, that say that those who are troubled with Aphatic, are not short-lived, but there is a great question to be resolved, and that being done, I shall put an end to those things that concern the Prognosticks taken from Worms. Astius a little before said that live Worms were worse than dead ones. But Rbasit and Antonius that as follows him, thinke the contrary, absolutely preferring the dead ones before the living. In which question, to pife over other men, I shall say what I think, that the strongest affettion is taken from those that are dead, because they must needs be driven forth, and cannot come forth of their own accord; yet I follow Hippocrates, who in a certain place useth some words that are difficult, wherein he would have us to consider diligently what symptoms Vomits breed, for if they come forth without any symptoms they foresaw a good sign. But he makes it clear elsewhere thus. It is necessary that round Worms should come forth with the excrements, when the disease comes to the Crises. So that by this we may understand, that if they be voided any other time, it is done rather symptomatically than by force of nature, and therefore they shew corruption or malignity, as Paulus and Astius distinguish.
The cure.

But because we can never rightly undertake the method of all way of curing Worms, unless the belly in which they are be well disposed, nor can this be unless the whole body be so, and this is excellent well performed by good diet; wherefore that in the first place must be well ordered, for without that all helps are in vain, for the preferring and repairing our health. For this is so famous, and almost the best part of Physick, that that admirable Cony, Celsus, Galen, Pliny, and almost all the old Physicians, could never give it commendations enough. Alexander formerly esteemed it so much, that he almost took away the method of curing by Physick, and wholly turned all curing upon diet. Now this consists not only in the quantity and quality of meats and drinks, but also in all those things that befall us whether we will or no, as in sleeping and waking, motion and rest, as also in the repulsion and emplacement of the whole body and of every part, and in the effects of the moon, but chiefly in the Air that is about us, which not only flecketh to us outwardly, but continually enters into the inmost parts of our body by the drawing in of our breath. As for what concerns those things that we take, because they are such things that every man knows, I shall say nothing of them. For there is no man ignorant, that divers meats, and of ill and naughty juice, and disorderly taken, will breed crudities, and that glutony and drunkenness do our bodies great hurt, yet many kinds of meats, that are hurtful in other diseases, are profitable in theirs. Wherefore we shall as it were besides our purpose, and by the way touch upon these, first adding what Paulus writes. Let the meats of those that have Worms be of good juice, that may easily be dispersed, and passe to the parts, and neither foster the caufe, nor weaken our forces.

Wherefore we grant them wine mingled with water, and let them eat often both for their need, and that the Worms may not gnaw them. If there be a scowring of the belly, it is a sign that many are bred, the meat being not dispersed; and in that case Pears or Quinces must be mingled with our broths; Wheaten bread is a wonderful help, having Annised mingled with it, or Fennel or Salt; or bread that is between Bran and Wheat, called gruyter E, because there are joined together in it, the Bran, the Hulls, and the Flour. Men call also this bread, victuage, because all the Wheat, without taking any thing from it, is made into bread. Also the wheate it fell that the meat is taken from must be the beet, for some of these have much Bran, which is the currier wheate, but the finer wheate is the beet. But wine that is mingled with water, because it gently bires, is held to be very convenient. Mountain birds are fit for their meat, and young wood Pigeons, green Grounded, and Geats-heard, the broth of Milk Chyckes, and Colwerts, and Capers, and pickled Olives eaten; and if there be no Feaver, let them eat their other meats with Mulhard, also four and only things are commended. Also Panick (which Doctors called the honey of Core) is most durable, so be it may be reckoned amongst Core. Also Spelt in the decoction of Myre, and a Piflam with a great quantity of Oyl of unripe Olives besides these, Lypuries, Cloves, Bees, Mints Smallague, R rith, and Fawce eaten are good. Give children before all meat, a decoction of Sebells with Mints. Milk is very hurtful, as also Firth, and Pulfe, and whatsoever is of a cold grosse substance, and hard to be digested. Bread unlevened breeds Worms, for it is good for no man, and so are all moyf meats, that easily turn to corruption within.

For all kind of Worms it is most convenient to use abstinence from such things as bred them. And when they are bred, it is good to eat often a little at a time, and that is beet, when they leave off gnawing. But those that have Acrasides must eat meats of good juice, and of easy digestion, that the force of them may not reach so farre as the right gut. For the matter fit to breed them is so consumed. Thus far for meats and drinks to be taken. But the other kindes that are not so manifest, shall be handled by us also with all brevity. And we shall begin from fleete. It must not be too little nor too much, and in the night rather than in the day, at least two hours after meat. Moreover, to be long iddle is nought, let exercise precede meats, and rest after meats. Nor is any motion to be taken for exercise, but that which makes us breathe more; unless it be when we have taken Physick against Worms; for then we must ride or run, to shake our bodies; for they are more easily call forth by hard exercis, for labour: but children will hardly observe these rules. Care also must be had, that the belly may twice be unburdened, and if that will not do off itself, we must use a Suppository or Clyther to provoke it, made of such ingredients that are fit for this purpose. All affections of the mind whatsoever they be, must be set aside, as quarrelling, anger, sorrow great cares, and thoughts, fear, feares, envy, and all such kindes of perturbations, and chiefly after meat. For these change and turn the body from its natural state. Let men beware of cold North windes, and let them not go barelfoot. The air because it always is about us, cannot be chozen at our pleasure: for it is sometimes a defence for us, and sometimes the caufe that makes Worms, or fosters them: It will be a defence if it be very hot, and dry, pure, clear, and calm; and it will chiefly foster the disease, when it is very cold, or moist, or moved by the North or South wind, or by too great heat, or by very great cold, or other forces, and then it must be thus prepared: To burn in our Chamber wood of Juniper tree or of Citro, or Peach-tree, and such wood as is against Worms. Also to perfume the place with tops of Worm wood, Peach-tree leaves, Citron pills, roots of Pomegranate trees, aloof with Fern, and Iy. But that is the bell that is made with Myrrhe, and Aales. Another remedy that succour the goring spirits, by reason of Worms. Amber greece two peny-weight, Musk one peny weight. Gum Aaback four peny-weight. Roses, Sanders, Cloves, Privet, Frankincence, of each one peny-weight Gallia Medicina so called, six peny-weight, Lignum Aoles burnt to a coyle twenty peny-weight, the quenched coales of Vice-branches, what is sufficient, make them up with Rose Vinegar.
Worms are of times exasperated with vehement remedies, that they bring children to convulsions, fwoonings, and death; wherefore they are not hastily to be given, and at all adventures of Worms. But because that remedies by reason of their different qualities are thought to be good to kill and bring forth Worms, therefore in general, such remedies as heat, drie, cut, and are sharp, bitter, salt, or low, and attenating, are to be used. For either they kill the Worms by their sharpness, or bring them forth by their bitterness, or they allure them to come forth, or else they are known to be good to bring them forth by the looseness that follows. They are brought forth 'tis likely at once, by such fopping means as make the pittages slippery, or by some effectual quality, that is namelesse. There are some good remedies that effectually drive forth Worms, and some by a hidden quality, as thaysings of Harts-borne. But those things are but that kill the Worms, for so long as they are alive they are an occasion of mischief. And they are hardly driven forth when they are killed, wherefore they must be drawn forth by Clylers; otherwise they send a filthy virulent vapour to the brain, and likewise inflame the body, and hurt the appetite and conception. But because Worms happen most to children, who are hard to be dealt withall, I thought it not fit to conceal that wonderful way that Paulus mentions, whereby Aloes, and certain broths are given to them by way of foppings. A certain Cooks Infrument or spoon that is called {c}io{c}eso is put into their mouths as they lie upon their backs, and by a little Clyfter with a strong Pipe, Aloes is forced down their throats, holding their mouths wide open as far as it is possible. Paulus makes mention of this, but doth not tell us what it is. But whatsoever Zemenyst is, we understand two things by it, that it is made defending, that thereby the bitterness of the Aloes is not called. But by that other Infrument that Paulus calls Clyferidium, it is forced in by violence. But force and nature concouring, the motion is most swift, the heavy matter running downwards, and is violently driven in by it. Paulus also describes another Infrument, whereby moyl things are injected into the fundament, it hath many holes quite through it, and there from the matrix are called Metrenchite: But Actius speaks clearer thus. To which purpose you must provide a horn Pipe that is full of holes through it, large at the bottome, and convenient for the largeness of the place, which being thrust in beyond the Sphincter of the Anus, we fill with juice of Cedar, so that the liquor may fire forth every way. But forasmuch as these Infruments are unknown to us, when remedies are given either to kill or drive forth Worms, πόλος the childes nofillis, and then wath its mouth with some sweet or sharp thing, and when he hath drank down the medicament to kill the Worms, his stomache must be fomented with Acacia or Hypocitis with wine. Those things that kill Worms are belt given in sweet milk or honey or Oxymel, or syrup called Acestus. Some first satisfie the children first with three days drinking of them, and then they give the physick afterwards. Also they give Clylers of the fame sweet things, that they may entice those Creatures to the lower parts. If the belly scoure, it is of necessity that the Worms must be killed at last, for the motion of the belly will call them forth. But when the appetite is hurt, and the belly loole, the Worms must be killed with bitter things only, that are somewhat altringent, as with Wormwood amongst hot things, or Southernwood and Worm-feed: Or amongst cold things, with Pomegranate pills, Acacia, juice of Plantain, Purflane and fuch like. Of hot things the feed of Creffes drives forth all belly-worms, bruised and drank in wine or Vinegar, yet more effectually if wide Mints be added, yet it troubles the belly. The meal of Lupins laced with honey or drunk as a Pothe, are outwardly applied to the naveel with Bulls gall, drives them forth. Those that are alio being inbued and eaten with their bitternesse. Also their deception can do much, being drank with Rue and Pepper. Sea Worm-wood boyled, or brayne, or with Rice, adding Honey to it, kils Worms in the guts, and it will do it better with Worm-wood, Southernwood the fame by its bitternesse; Cardamomum kils them. Also the decoction of Hytop drank, or the herb it self laced up with Honey. So Calamint kils Acrarides, and other VVorms, if it be drank with salt and honey, or if it be eaten raw or boyled, or the juice of it given in a Clyfter, or drank. Also the decoction of Thyme, or Rue boyled and drank with Oyl for eather them out. Also wine of Cedar, and the liquor of Cedar it self. Unripe oyl of Olives, if it be drank plentifully, for it is presst out unripe for children. Juice of Oenanth hath the fame operation, as oyl of unripe Olives. But the best thing against VVorms are sweet Apples called St. Johns Apples, for they loothen the belly, and drive out the RVorms; which by what faculy they can do it, (being they are sweet, and of a honey taffe, from whence they borrow their name, and since fo they shall rather feed RVorms) is perhaps, because by this meat the belly is made looffe, and the RVorms follow; and the RVorms that otherwise would flay within, by the force of the excrements, as Fitches in a torrent are carried away, when in Summer great rains fall, and so are they carried downward. For Diogaridies lib. 1. cap. de Melimenta, faith that those Apples make the belly solubile: Also the feed of Coleworts, especially that which grows in Egypt, drank, drives forth RVorms, namely, because the temper of it is drier, and more wilde. The fame is done by Oyl of Palma Christmas drank. Myrrhe also by its bitterness both kills and drives them forth. The decoction of Elecampane, Squils taken with Vinegar and Honey, but the Squils must be first rost, and otherwise it is held to be most pernicious to the entrails. Also they use to give against all RVorms the decoction of the root of Capers in honey and vinegar. And Diogaridies lib. 4. cap. 1. writes, that the herb called small Turn-foill drank with the feed, adding thereto Nitre, Hytop, Creffes, and water, will force out all fortes of RVorms, long and flat. But Paulus unless there be an error in the Prefcvections Cardamomum for Creffes, lib. 7 c. Rocket-feed in wine,will drive out all living Crea-
The Theatre of Insects: or, Book II.

Cold Simples against Worms.

I also seven or five Earth-worms drunk with sweet wine, will drive out all kinds of Vworms: Bitter Almonds and the Oyl is good. Agrick with Honey, but it purgeth with trouble; for it is hurtful to the stomach, by making it slippery and loofe. Storax flavished with Rotin of Turpentine: Aloe drank in cold water or milk, the fame drank in a decoction mingled with Honey, brings them forth without trouble. The feed of Tithymal or the juice of it about five drops mingled with Figs or Dates. The leaves of Agnus Callus, Polygodne, Chamepythe, Centaury the leaf, bruised and drank with Vinegar. Also one peny weight of the root of the same drank in three Cystis of wine, doth help. Herehouse with Wormwood and Lupins, boiled in water and Honey, of each alike, and with wine applied twice or thrice, kills all Worms in the belly: Collins by its bitterness, with water kills all Worms. But Distiforides li. 1. writes that it drives out only broad Vworms, with water and honey; which place Marcellus interpreting, blots out that word [and honey] as put in amifsie, for this reason, because it is contrary, and seems not to agree with the cure for Vworms. For faith he, they are raised and nourished by sweet things, and belly Vworms are not driven forth by them, unleffe perhaps Honey must be therefore added, that they being deceived by the sweetneffe of it, they may take in the bitter Collins in greater quanti- tity, as we use to do in curing children, when we give them bitter or strong poisons, we cover them with some sweet favour, or pleafant smell. In which businesse he seems to feek a knot in a Bull-rush (as we read in the Comedy) and yet he confefeth it to be otherwise. For whether the word Honey be read in Distiforides or not (for I am not yet certain of it, nor hath Basileus set it down) it is sufficient that bitter Medicaments, (such as Collins are, and such like) were given alwaies almost by Distiforides, Pliny, Galen, and others, for to cure Worms, with sweet things, and chiefly with Honey, or Mede, or Ozymel, for the fame reason that Marcellus mentioneth, lib. 4. cap. 57, which Paulus added in these words. Because some men oft times refuse bitter poisons, as having an ill taffe, of these thing herein comprehended, they fhall not give any that are manifeftly bitter, but mingled with some sweet thing, as he saie a little before, that all these medicaments must be mingled with Honey or Ozymel, and so given to drink: Or as Lucetius faith, that the improvident Age of young people may be deceived, or else may be able to take it, being enticed by such a taffe. For children most commonly are subject to Worms. Therefore nothing hindereth but that the word Honey shoule be added, as Marcellus himself testifies, if we read him in some old Copies. Likewise a Cantharis bruised, and drank with a Briony root, drives forth Worms, as Galen writes, lib. de compof. Theriacs. Of cold things, the juice of Moufe-eare, with Ale, of each one Cysthus. Groundef eaten, the juice of Plantain, especially when the belly is loofe, given one spoonful or a small measure to drink, and the herb felf bruised, laid to the navel. Coriander feeds with the juice of Pomegranates and Oyl delthroy the Worms in the guts, or drank with sweet wine. Hot things, as boiled Beets, taken with raw Garlic, by the Nitrous quality it hath, brings them forth, but the juice is hurtfull. A Pomegranate bruised, and boiled in three Himina of wine to one He- mina, drives forth Worms, takes away the pain, and the juice of the root one dram and half weight, will kill them. Sumach of Syria will do the fame, and the feed of Orache. Our new writers adde, that it is manifeft by experience, that the sharpett Vinegar drank when we go to bed will drive out the Worms. But amongst thofe things that prevail much is Corthinia, so called, which was powdered or mingled with Honey or Ozymel, or drank with Honey-wine, doth wonderfully kill Worms, or drive them out half dead. This took its name from the likeneffe of Corally, fince both of them grow in the water, and for sixty years almoft it hath been used to good purpofe to drive forth Worms; if I be not miffaken, this is that which Distiforides lib. 4. and Galen call Pao ou- xane, that is, Sea-mofle; and if that they did not attribute it to the fame force we do to the forth Worms, as we fee in Corallina, as they call it, I fhall not therefore think that it is any thing elfe, besides Distiforides and Galen feem to: For the Ancients did not know the vertues of all Simples, for the true nature of each cannot be found out by any other way than by its effects in phyllick.

A mighty work and fecret from God, than which there can be no greater found out. Also many things are found now adays that were not found out in our forefathers dayes; and no wonder, since these experiments are made by Countrey-men, and fuch as are ignorant of learning, who commonly live only where they grow, besides the negligence of feeking, when there are fo many Physicians it hand every where. Also many things are found out that want names: To this we may add the uncertain way of finding out; for in things that are found, fome were found by chance, faith Pliny, lib. 25. cap. 2. others were revovled by God. But the foulefe cafe of this rarity is, that they who know thofe things will not difcover them, as if they should quife lofe what they acquaint others with. They are as envious indeed as thofe are who either suppress the monuments of Antiquity, or else utterly demolifh them; which they for that end, what is written by the Ancients may be attributed to themselves, or if they have delivered any famous matter, they that write other mens opinions will let that be left. But if there be any that will contend, and fay it cannot be that they shoule be ignorant that Sea-mofle was good to drive forth Worms, to thofe I anfwer, that the Ancients did not commit to writing all the natures of Simples that they knew. For we know many of the precepts of Pythagoras and Secretes; which yet cannot be known out of their Books, because they wrote none. And Pliny though he left fo many Books in writing, yet besides thofe he wrote, his followers take many things for his that he never put in writing. Nor hath that Sover growing in every place, as they report, the fame faculty, but the Apothecaries in fome certain places of Italy fith for it, and they fell it under the name of Corallina. But let this suffice.
Of lesser living Creatures.

This is rather to be enquired into, why, being that Corallina tannis salt, Digestion, Pinia, Galen, and others report it to have a cooling faculty, when as it is known that all salt things are hot, and earthly, not unlike to bitter things that are hot? Whether it be, because the sea-water is salt, yet hath in it a great deal of potable water (as Aristote hath sufficiently demonstrated it) and therefore by that it is the fels hot? Or else because it contains in it much earth, and so it is drier and thicker? But such things as grow in the sea, mutt needs be of the same faculty with it. Because therefore that Sea-moss grows in the sea, Digestion, and others attribute to it a thickening quality, that it contains in it much water fit to drink; and as of an earthly, by that it costs. Lastly all that are troubled with Worms, are helped with the smell of the hair of echinomon (they call it the Indian rat) as Paulus writes.

The juice of Horehound drank in Wine, will drive out of the belly round Worms: Worm-wood Wine drank both the same. The herb of great Turnifoon drank with its seed, adding thereunto Nitre, Hyloph, Creffes, and water, will call them forth. The fruit of female Fern 3 drams drank in Wine, will force out the round and broad Worms of the belly, as Rueflus Worms round, and Marcellus, who interpreted Digestion, do both affirm. But Galen faith that it kills not Afaicades, and round Worms, but Afaicades and broad Worms, for so he writes, lib. Therapeuten. method. cap. 14. broad Worms.

But Wormwood can destroy round Worms, broad Worms require more strong helps, as Fern is, and so doth that Worm the Greeks call 'Ανίσοσ. Theophratius was of this opinion, who writes that female Fern mingled with Honey is good against broad Worms of the belly, if it be mingled with Honey; and for Afaicades, in sweet Wine. For so he fets it down: Female Fern is good against broad Worms and small ones: against broad ones mingled with Honey, but against small ones in sweet Wine. It is certain that Afaicades both are, and are called small Worms. Moreover, Galen lib. de simp. Medic. foctul. 8. ascribes the same virtue to the female Fern, that the male hath. Now Pliny writes that the female will kill only broad Worms and not round. Plin. lib. hift. 27. c. 9. and again, that both, (that is, both male and female) will drive forth Worms of the belly, broad Worms with Honey, the rest with sweet Wine drank for three days, and he excludes neither round Worms nor Afaicades. But Galen in one place excludes both round Worms and Afaicades; and in another place he writes that it will destroy Afaicades with broad Worms. What now shall we say, where Authors are of so many different opinions? shall we say that female Fern will kill all Worms in the belly? For Galen ascribes the same virtue to it he both to the male, but that especially it kills broad Worms, and in the next place Atticus, which being at the bottom of the belly, require a stronger remedy, as Fern is, that the force of it may come so far. But since it can drive forth broad Worms and Afaicades, that are more feldenome, and the one is in the guts, the other fartherth from the stomac, it will far sooner destroy round Worms that lie in the upper guts. Galen therefore will not fight with himfelf in this, for it sufficeth if it will kill broad VVorms, and if it can destroy them, it can more easily destroy Afaicades, and easiest of all round VVorms. But Pliny, as who bef both of all knew that, faith it will drive out the rest alfo, (that is, both round VVorms and Afaicades). But that he faith fo is manifet out of Paulus, lib. c. 53. who in his method of curing round and broad VVorms, mentions Ferns which are all meagine is most properly used to drive forth broad VVorms, Athen. 16. Tertt. tradt. 5. c. 4. thesems this most clearly in these words: The medicines that kill Afaicades are stronger than those that kill long Worms; and those things that kill long Worms and Afaicades will also kill broad Worms. Gith or Nigrella not only eaten but laid in a plaifter to the belly, or anointed on the navil with water, brings them forth. In which place we must note Marcellus, who faith it will drive forth broad VVorms and not round: but Rueflus interprets this by the contrary. If Marcellus have done right, I leave other men to judge, this is certain that Galen is of Rueflus minde, who hath written only that it will kill VVorms; and as I said before, it is taken generally for round VVorms. Paulus and Aetiucus, agree with Rueflus, who in their curative method for round VVorms, often speak of Gith, but never for broad VVorms. Wormwood called Santonicum, of it self or boiled with Rice, adding Honey to it, will kill Worms. The seeds of Nettles bruised, or of Coleworts or Cummim, with water, or Mints with it, or Hyloph with Honey and water or Cretelles seed bruised with Vinegar, kill them. Ceflus lib. 1. 4. 17. Orbifius lib. ad Eunipsum filium, hath written that Calamin, Cardamom, Lupins, and the powder of them in drink, or with Honey by way of Elechuary, or given in Pofca to drink, are sufficient to kill round Worms. Also the leaves and buds of the Peach-tree bruised, and laid upon the belly the can do as much; also Mints in drink and Sorrel. Purslain boyld, the juice of Succory, or the decoction of Sebeflens, or the Sebeflens themselves boyld and eaten are very good. Also the ashes of burnt Harts-horn is thought very effectual for this use, especially of that which grows on the right side of the Stags head. It is burnt thus: Break the Harts-horn, and put it into a new earthen Crucible, and lute it well, put it into the furnace and let it burn till it be white. Scribonius Largus, c. 141. gives it thus: Harts-horn, faith he, ripe with a workmans raph, with water of Sebeflens boyled, give 4 or 5 spoonfuls of it, which were sunk the day before in 3 cyathi, then bruife and give it, adding the water to it. An Oxe thank burnt, and drank with Milk, drives out round Worms, faith Galen. Ceflus with water drives forth broad Worms of the belly. Galen de com. Ther. ad Plf. Cardamom, Garlick eaten. The leaves of female Fern taken with Honey in a Lohock. But the root of the male 3 drams with Honey-water drank, will drive Cccc them
them forth, but better, if it be given with so many oboli of Scammony, or black Hellbore. Al-
so the root of white Chamæleon, drank a fawcer full, for which use it is drunk with
Wine and the decoction of Origanum. Walnuts eaten largely, the pill of the Mulberry-root
boyled in water and drinks; besides that it loofeth the belly, it will force out broad Worms;
also the decoction of Pomegranate roots drives them out and kills them. The decoction of Pom-
granate pis can do as much. The root of wilde Buglos, a fawcer full, with Hylop and Car-
damom drank, doth the like. Aurellius the Interpreter of Deuterides, seems to have followed Paul-
hus, who saith that with Hylop and Cardamom: but Aurellius, faith, with Hylop and Crefles
drank, it will drive forth broad Worms, what was said before of Turfoil, Aurellius feems with
Hylop and Crefles. But the juice of Cedar kills Alcarides, and so doth Calaminst, the juice
of it being drank or given in a Clyfter. The decoction of Wormwood, mingled with oil and
given Clyter-wife, and the decoction of the leffer Century given with Salt-peter and Honey,
hath the fame force, or the decoction of the wilde Gourd, of wilde Saffron, if the right inter-
fine were firft emptied with sharp pickle. The root of female Fern drank for three daies in
3 drams of Wine, drives forth Alcarides. Also old Hogs grease put into the Anus, is excellent
good.

Both Paulhus and Aurellius tellifie that Feavers commonly accompany round Worms, and we
found it true by daily experience. When therefore there is a Feaver, sometimes we muft take
care to curc the Feaver and the Worms, and sometimes taking little care for the Feaver, we
must strive to drive the Worms out of the belly. For many that have neglected them have died
torn and eaten up by them, and some fay they have feen them come forth at the groins. But
we muft firft kill them all, and then drive them forth; they are killed chiefly with bitter things.
When therefore the cureis common both to the Feaver and the Worms, the more fimple reme-
dies are convenient, and where the difafe is uncertain we muft use things that are more milde.
For the Feaver is exasperated with strong remedies if we fhoule be miftaken; but when we are
certain how the matter is, we muft wait for the times of the difafe. For about the firft daies,
and the rather if they fhould appear then, we muft use stronger remedies. But thofe that ap-
pear when the difafe declines, are more easily cured, and the better if there be no infammations
or tenfions of the bowels. As Hippocrates faith well, ib. Apb. 1. c. 24. In acute difafe but fel-
dome, and that at the beginning we muft use purging Medicaments; and this muft be done with
premeditation, for thofe fwel molt, and are regarded as 'tis ofte seen, and therefore about the begin-
ing of thofe difafe, we may use sharper means with profit, but there muft be much cau-
tion, and premeditation ufed therein. Firft examining whether the patient can endure fuch re-
medies, it be prepared rightly for them, and whether we may expect a right Crifis by giving
them. For there is no small danger in an acute difafe, as the ficknefs of Worms is, to ufhe strong
remedies, becaufe all fuch means are potentionally hot. Therefore we that fuffer infammations
and exftentions, muft have Cataplafs of Linifeed, with the like quantity of meal of Lupins ming-
gled, or elle moult fomeraffions or yl of Cineammul, Wine, tops of Wormwood, and Aloeis laid
to their Pracordia; but where moderate Feavers moleft, give children before all meats, the de-
cocion of Myxato-drink, or givethe them the Sebellens themselves to eat with Mints. For thefes
things wonderfully help thofe are troubled with Worms, either becaufe, faith Serapion, they
flick by reafon of their sweetnefs to them, or else there are fo glutinous, that they cannot be
parted from them, and fo muft come forth with them. For Myxa are very clammy, that in
Syria the belt birdline is made of them called Damask-birdline: wherefore becaufe by their
clammines they bring forth Worms, if they trouble the floromach, they muft be given by the
mouth; but if they bein the belly and guts, by clifter: but to fuch as are come to ripe years,
flronger remedies may be given, as the decoction of Wormwood or Southernner, or the force of
the root of the four Pomegranat boiled to thirds, alfo three scruples of waffh Aloeis is given,
which is the molt commendable remedy for thofe that are flrong: alfo we ufe unflawh Aloeis,
and both, if they be feaverith, and but three moneths old. Earth-worms with boyled sweet
Wine may be given confidently; but if they will not drink sweet wine, give them with water and
honey, or as you thinke fit, fearing nothing, not defpifng the meannefs of it, give 9 or 7. But fitte
be not a naked infufion, but a certain knowledge that there be Worms, and that a proper cure
belongs to them, then you muft lay on Cataplafs with Lupins meall boyled in sweet Wice, to
which alfo sometime a root of Briony muft be added. In the mean time anoint the navil well
with Buil gill, or Gith bruised with womans Milk, or with Wormwood, or Southernner, or
Briony mixed with fat old Figs; anoint all the Spina dorsi with Deer-fuet, and cover the upper
belly with a Cerate made of Wormwood and Cyprefs oyl. Moreover a Suppoftier muft be put
up where the belly is bound, efcpecially for children, and if it profit not, then give a Chifter, the
vigour of the difafe abating, made of the decoction of Wormwood, or Southernner, or Can-
fary, with Honey and Nutre. And we fhall endeavoure to draw them out by fuppings, that make
the paflages flippers, such as oyl of unripe Olives, fuppings up by little and little two times a day
of it, for as it is bitter it kills Worms, and as it is gentle it cleans them forth with the dung. But
we muft alwaies inrease the pottions of oyl for they are very commodious. The Worms come
forth, some yet alive, but they are giddy, and as we may fay half killed, and many come out de-
ead with the excrements. Moreover Worms will breed when there is a fcowring of the belly, we muft
cure
cure them by hopping the flux, and by bettering the concoction with meats and Cataplasms. For the more the flux grows, the more the Worms breed; and when the flux ceaseth, the Worms do the like: wherefore we must diligently endeavour that the belly may be fopt and strengthened; we must therefore add to such Cataplasms as serve to stop other fluxes, such things as we said to be good against Worms, and that causeth no fluxes, such as are Wormwood, Southernwood, Santonicum; also Pomegranate pils, Acacia, Hypocistis, Balautia, and the like, with raw Barley-meal. Also Cerats laid on must be made of these. Also fuppings must be used amongst all which the juice of Plantain is belt; and the dry Plantain, for it is good both against the flux and the Worms. Furthermore the V Vine of the Pomegranate prefixed forth with shell and all helps exceedingly. But for nauseating that arieth from V Worms, and growing of the stomach, a grain of Salt held in the mouth, and melted and swallowed down, profits wonderfully, for it should feem the tartness of it, makes them presently fall down. But if a look ap arise from the same causes, pils are good, that have the juice of Radder-spin, Wormwood, Santonicum Water-mints, Scorodium of each four penny weight, boil them to the thicknes of Honey, then add fifty penny weight of powdered Aloes, and make pil of all, and swallow a penny weight, for this will take away the look ap, and kill the Worms. But if from the Feaver or filthy vapours arising from Worms, or the fumes of Medicaments (as most of those are that are given against Worms) rise to the head, so that there be great pain thereof, then anoint the forepart of the head, the forehead and temples with oil of Rofes, or the juice of Acacia, or of Hypocistis mingled with it, for it is most effectual. Others lay on leaven with a little Saffron and Vinegar, on these parts being appointed: for this cures all intemperate sleep, and other perverfe affeces. But amongst thofe men call Syrups, fyrup of Wormwood, Calamint or Horehound are commended: or make one thus: Take juce of Mints, Elecampane root, Wormwood, Rue, purified, for it is taken the foidment being call away, of each of them ha a hemina in weight: of the juce of Succory and Grafs, of each of them seven cyathi in weight, infule in their torrefied Harts-horn, Su- mach, Purflian feed, and flowers of wide Pomegranates. ftrain the decoction and make up all with Sugar, or the purelt Honey of Athens. Another: Take Southernwood, Calamint eight penny weight, Horfe mints, Elecampane-root freef, fix penny weight, boyl them in water to a third part: this decoction is given with fyrup of Wormwood, or Oxymel of Squifs. Alfo Wormwood-wine is much commended for thefe uses, but it is made divers waies, for fome let down Celtick nard 40 draams bound in a linnen clout, into a meafure of new Wine, and after 40 daies they strain it. Others caft a pound of Wormwood into 20 fextrami of sweet Wine, and a fhift part of Pitch, Roífn, and after ten daies they strain it, and lay it up for use. A fyrup againft Worms, with a Feaver and the fymptoms: Take fifteen penny weight of Grafs-root, Purflain- feed, fourk Dock, of each eight penny weight, ten iebeffons, boyl all to thirds, to ftraine the juice of Pomegranates, and Oranges, or lowr Wine, of each one and half cyathi in weight, as much of juce of garden Succory, the bell Sugar what may fuffice, boyl them to a fyrup: you may give Infants half an ounce, and young children one ounce without danger. A Julep that fhall help thofe are affected with Worms: Take Dittany of Crete, Gentian Zedoary, Arabian Coftus, one penny weight, feeds of Coleworts, Dill, Wormwood, Purflain, of each alike as much: water of Mints, Wormwood, Grafs of each half a hemina weight, boyl them to thirds and ftrain them, to thefe add of the bell Sugar twenty penny weight. But in a Feaver you may, give the decoction in water, or Grafs-root. Wheats, Barley, of each fifteen penny weight, to a large quantity to drink. Another moft effectual and very fweet: Dillihed water of Sorrel, Rofes, Grafs, garden Endives, Buglfs, juce of Pomegranates, of each on hemina weight, feeds of Purflain, Orach, Sumach, Citrons, of each three penny weight; Coriander-feed, Myrftle-berrises, wide Smallage, of each two penny weight, feeds of fourk Dock, Coleworts, Cummin, of each the fame weight; red Rofes, Tormentil, Barberries, of each two penny weight, fo much weight of Balautia, five penny weight of the ashes of burnt Harts-horn, white Dittany of Crete eight penny weight; the blefs of Mulberry-roots barkd. Fern-roofs, of each two penny weight, ten Bellets, one penny weight of red Coral, white Sugar what may fuffice, make a Julep. But the moft prefent remedy of all is that the Apothecaries call commonly Diureptpam, but chiefly with Rhubarb, three draams oft being swallowed down; which being it is proved by long experience, fo it hath alfo great reafon for it, that it fhould be preferred before all other remedies. For children enticed by the sweetnefs of the Antidote, will take it down willingly, and the Rhubarb kils the Worms, and the parts are strengthened by it. The Turphec drives them from their nells, and the reft of the ingredients do not only make it pleafant but harmlefs, fo that it is molt fweet, harmlefs and strong all at once: it is made thus: Take white Saffrers and red, Violets, Ginger, of each two penny weight; Annfed, Cinnamon, Saffron, Millick of Chius, each one penny weight; Myrtaria, which the Apothecaries call Turphec, eight penny weight; Rhubarb, ren penny weight. Scammone as it is usually prepared, four penny weight, the pureft Saffron Penny weight, make up all with this: and make Trophees (as the Greeks call them from the form) each three draams weight, where you have need of them, give one for this difafe. Another Antidote: Take Rhubarb, Saffron, Scammone, Wormfeed, Dittany of Crete, each two penny weight, the bell Sugar eighty penny weight, make them up with Grafs-water, and make Tro- chees; one penny weight of this is given to Infants without danger being dissolved in Grafs-water. The powder I use is good, and a powder thus prepared: Take Rhubarb, Agrarick, Germander,
of each two penny weight, Sea-molls four penny weight, Wormicede and Purflain-feed of each two penny weight, unwhashed Aloes fix penny weight, give a scruple of this or two oboli in Wine to children daily. Sometimes all these are bruised and sifted and made into pills with the juice of Wormwood or Mints, and three of them are swallowed down. Another for the same by another Author: Take Harts-horn burnt, the lefs Century, Mints, Pomegranate pils, Carway-seeds, Sumach, of each two penny weight, Carduus Benedictus, feed, thavings of Harts-horn, and of Ivory, of each eight penny weight, the bark of the roots of Mulberries pill'd, Colewurt-seeds, Citron-Apple-seeds, bark of Willows, of each fix penny weight, Purflain-seed, Dittany of Crete, four penny weight of each, Pearls, red Coral, of each two penny weights dry them and bring them to fine powder: one or two drams of this with Wine in winter, and where there is no Fever, or with Oxycrate in summer or to those that are in a Feaver is safely given. An Antidote that kils Worms, diminisheth a Feaver, and helps against pains of the heart: Take Wormfeed, Sea-molls, seed of white Smallage, Harts-horn burnt white, of each alike, infufe them all three daies in Vinegar, wherein let these things first boil, Purflain-seed, Sorrel-seed, Sumach, Coriander, Colewort-seed, and a little Myrrhe; then dry them, and add to them Orange seeds two parts, Citron-seeds one part, make them up with Sugar dissolved in the Wine of Pomegranates, and make morfels, to which you may add some little Cinnamon and Musk. But because it hath been seen oft-times that Medicaments outwardly applied have done much good against Worms, it is but reasonable that I should let down the manner of them: For by these we not only defend our bodies, but also we kill the Worms and drive them out of us: wherefore this may suffice that hath: Lupin-meal, lefs Century leaves of Peach-tree and Howshound, bruise them with Poica and lay them to the belly. Another tried by our master Plutarch: Take the lefs Century boyled in the oyl of Peach-kernels, anoint the Navil with this, and it will drive forth the Worms. Another: Tolf Barly-bread, and infufe it in Vinegar, then prefs it out, and infufe it again in the juice of Peach-leaves, lay it on warm to the belly with a linnen clout. Others mingle Lupine meal, Southernwood and Bull's gall. Again: Take Lupine-meal, Century the lefs, of each four penny weight, Aloes, Bulls gall, of each 4 oboli, make them up with juice of Wormwood, and laid to children very young. Another: Take Wormwood, Guth, ashes of Harts-horn, of each a like quantity, mingle them with Honey and anoint them. Another good for the stomack, that kils Worms, and is good against the belly flux: Take Wormwood, Mints, Roens, Santonicum, Lupin-meal, of each eight penny weight, tosted bread, infufe in the sharpefet vinegar four penny weight, Bulls gall sixteen penny-weight, Mountain-nard, Water-flags, (Galla called Moschatas) Cloves, sweet Cane, Nutmeg, Galanga, Carway-feed, of each twelve penny weight; Hippocyclis, Acacia, Sumach, of each four penny weight, oyl of Myrth, juice of Mints, and Wax what sufficeth, make a plaster. If there be no Fever, the navil and thighs are to be anointed with Honey, in a hot affect with Milk, and then a little Aloes is browed on, for it wonderfull kils Worms, also the noffris are profitably anointed with Theriac and Vinegar. A Circate against Worms out of Paulus: Take Aloes, VVormwood, Lupin-meal, Seriphium, Guth, of each of fix scruples, VWax an ounce and half, oyl of Camomeul what may sufficeth, make them up being bruised dry with Bulls gall. Another out of Actiuis: Lupin-meal, VWormwood in powder, Barley in fine powder, of each seven penny weights; Bulls gall, eight penny weight; ratling of Harts-horn, four penny weight; VWax, twenty fix penny weight; week oyl, twelve penny weight. Another approved: Take Aloes half an ounce, Saffron two oboli, juice of Pomecitrone as many drams, mingle them with sweet white VWine, and apply them to the heart. Another approved: Take Bulls gall, 30 penny weight, chose Frankincence 128 penny weight, Strong-water 2 heminches, distil all these chymically and in a glafs veffel covered with VWax, keep what comes forth, and use it when occasion is. Another very excellent, that kils and cures the Worms: Take VWormwood, Gentian, Century the lefs, bark of the roots of Mulberries, Bay-berries with the kernels taken forth, bark of the roots of the Pomegranate-tree, 4th-root pils, of each 16 penny weight; Marjoram 16 penny weight, Santonicum Aloes, Myrth, Agrimony of each 4th-root, Marjoram of Crete, Germander, Southerness, 3 penny weight, Poly-mountain, Grafs-roots, each 1 penny weight; Staraschas, Chamadrys, Chamemytea, Pomecitrone-feed, each 6 penny weight; ashes of Harts-horn, Santonicum, 4 penny weight, Coloquintida, feed, 2 penny weight, Bulls gall 24 penny weight, the sharpefet Vinegar 1 heminches and 3 cyathis, a gallon of bitter oyl of unripe Olives, and 6 heminches; let the dry things be beaten into most fine powder, and mingle them ten daies together, on the eleventh day let them boil in a double veffel until the Vinegar be consumed: when these are cold, add one heminches of oyl of Bayes, bitter Almonds, and Peach-kernels, of each beaten 24 penny weight; all these, as the former, must be put into a glafs veffel, and be diffilled. Another most excellent and sure: Take Peach-kernels, Garlick, Earth-worms wathed in Vinegar, of each 24 penny weight; Gentian, Dittany of Crete, Grafs-roots, and Piony, pils of Mulberry roots pilled, of each 52 penny weight, Saffron, sweet Cane, Cloves, Aloes, Calbanes, Coloquintida, Ginger, Nutmegs, Callia, long Pepper, Frankincence, fruit of Ballome, red Coral, of each 8 penny weight; the belt Thricack 12 penny weight, Mints, Wormwood, Century the Lees, Peach-tree leaves, headed Leeks, Pennrioyal, Calamints, Plantain, Rue, black Hore-
Horehound, Bay-leaves, Sage, Marjoram, Betony, Scorodum, Orange-pils, and bark of Mulberry roots, of each 16 penny weight; seeds of wide Smallage, Purlflain, Radifh, Colewort, Santonicum, Plantain, headless, Leeks, fea Mofle, garden Smallage, (that is, Parly) each 12 penny weight; the sharpell Vinegar, juice of Quinces, of each one hemina; oyl of Mallick, Spike, liquid Bitumen, (they call it Petrolowyn) oyl of Bases, of each 16 penny weight; the oldest Oyl, or oyl omphacine, 8 hemina; beat the dry things to powder, and mingle them, and in a glased vefell fet them under Horte-dung for a moneth, then boyl them in a double vefell to thirds, drain them when they are cold, and draining them out forcibly, keep in a glafs. what comes forth for your ure. But employ it in aift anoint the temples, then the nofliris, next that the spondyls of the neck, four of them next the throat, then anoint the pulles of the arms, next to that the fomach, I mean by the fomach the mouth of the ventricle, taking the word fomach improperly, for properly it fignifies the fomach; wherein I muft not paffe over the error of our new Physicians, who in affects of the mouth of the fomach, lay their remedies upon the back over against it, which is both contrary to Galen, and alfo to reafon, 2 & 10, de med. cur. libro, yet I believe Thomas Linacer did not rightly interpret that place, if I be not mifaken, who was indeed otherwise a very learned man, and moft skilful in the interpretation of Authors; but it may be that Greek Book was faulty, or for some other reafon. Alfo it seems agreeing to reafon, that for affects of the mouth of the fomach, the remedies should be applied before, immediately under that round griftle, which they call the fiedel or sword-fash'd griftle; for at this place the mouth of the fomach beft receives the force of Cataplamfs and Cerats, forasmuch as there are no bones to keep it out of, but the properly called fomach, that is, the throat is fenced with moft strong bones, as under a fence; for it hath the beft bones before, and the back behinde. But this is spoken by the by. Now between the wetting of one place, and of another, we muft flay fo long as a man might walk about 40 paces; and when these places are wet, we muft use more distance of time, when we anoint the reins and the navil. And thefe three remedies are fo certain, that unless a childe be ready to die, he will recover from the point of death only by anointing these parts. That which is called the broad Worm abounds in thoofe that have no Fever, and breeds in long during diifeses. The method to cure there is the fame as for round Worms. For bitter and sharp potions are moft in ufe, and to eat Garlick or Calamin, Dittany or Pennirroyal; we muft eat Garlick largel for three daies, and old soft Cheefe. Next let a man eat of Meza- donian Fern dried and powdered and sifted, 8 penny weight, with as much Honey as he pleaft; al- ter four hours give the patient Aloe, and Scammony, of each one half dram, in Honey-water 4 cyathi, when he begins to rise to floo1, yet hot water under; Alfo give water to drink in which Lupins, or the bark of Mulberry-tree is boyled, or to which there is added a fawcer full of Pepper, or bruifed Hyop, and a little Scammony: or elfe after the eating of Garlick we speak of, let him vomit, and the next day let him gather as many Pomegranate roots as he can hold in his hand, and bruife them and boyl them in 3 fectarit of water, to a third part remai- ning, let him put a little Nitre to this and drink it full, three hours then paft, let him take ney of 3 oboli, two Potions either of water or falt picke added to it; Then pour forth the hot water into a leafon, as I faid: alfo give Earth-worms to drink, for they are exceeding good. But the juice of mouse-ear is proper for them, drunk two cyathi with one cyathi of Ale: for it quickly drives forth the broad Worms. But this remedy following must first be drank; nor is it thought unfit for thoafe that have Worms, especially if they have no Fever. Out of Pulset. It confines of red Nitre, Pepper, Cardamoms, of each equal parts, mingle all thefe and give of them a spoonfull in Wine or hot Water, for it quickly brings them out. 

Another, which is an Elecratory of Pulset. Take Pepper, Bay-berries cleaned, Ethiopian Cumin, Mallick of Chiant, of each alike, Honey what may ferve turn, give one spoonfull in the morning, and let them sleep upon it; but if you would do this more effectually, add Nitre as much as of each. Another of the fame. Take Fern a fawcer-full, Nitre two penny weight, give it with a spoonful of water, after eucuation, but it is better to add a little Scammony to it. Another of the fame, and of Atius. Take of the bark of the root of a fowre Pomegranate, scraped from the upper part, Pepper, of each four penny weight, Cardamoms fix penny weight, Horehound two penny weight, the beat Honey what is fufficient, give one spoonfull of it after eating Garlick or Leeks. But that the difafe may be wholly driven away, give fome Theriac, for Galen highly commendeth it for this ufe. Another out of Orifabius, that he alwayes used by the experience of his malters, and had a long time proved it for good. It contains Scammony one Scruple, Euforbiwm as much and half as much, the powder of burnt feathers one fcruple, Nitre in weight one Siliqua, give this to drink in honey'd or fweet wine. But it will fall out better if he first eat Garlick or two or three things. Also here is a Plaifer of another Author, that is good againft all Worms, especially broad ones. Take Lupines, Bay-berries cleaned, Bulls-gaiL lay them on the navel, and bind it on with a fwaltheband for one day and night, or else for two or three daies. Against broad Worms from another Author. Take Southern-wood, scraped Harts-horn, Cicus gnadus, and Seftum, of each one penny weight, Cardamoms three oboli, give this to drink with Oyemel. Another for the fame ufe. Take Gum Arabick, one penny weight, Fern three penny weight, Cardamoms one penny weight, Nitre three penny weight, give it in Hydromel or Ale. Also againft the fame, is the Antidote called Dia- pharon. Take Fern eight penny weight, Scammony, Gith, Cardamoms, falt Nitre, of each two penny

Cccc 3
weight, give it in Oxymel or Ale, but add Polyopode four penny weight. It is reported, that Aracides will trouble children, and such as are come to their full growth. But children are continually provoked to excoriation, and after ejection they are the better most commonly, but those that are come to their full growth, observing the trouble of such things that are the cause of them, will thruff their fingers into their fundament, and pull them forth, and further they will foment and abate these biting pains, with pebie-flowes that lie in the Sun on the thores, or else with ftones put into the fire. But for me will admit of none of these helps; yet this disease ought not to be neglected, for Worms will not easily yeeld to remedies, nor are they easily driven forth, but by strong means. Wherefore children must be purged with Suppositoris made of Honey and a little salt, or Nitre, or sharp pickle, and with the concoction of Woodworm mingled with Oyl. Also there ought to be a stronger purging, and when they have voided their excrements, the Longanum, which is the place affected, must be anointed with it. As for Simpleys, they are Acacia, Hypocitlis, the juice of Sumach, with liquid Allome or Nitre, but the Compounds are the Troches of Andron, and those that are called Springades polydye, and with fat Wooll and such like; for the feath is made stronger by Astringents, and looeth its readinesse to breed living Creatures, and thruff forth the Aracides. Andon his Troches are made thus. Take flowers of Garden Pomegranates ten penny weight, Gallis eight penny weight, Myrrhe four penny weight, long Birthwort, and as much Vitriol, Saffron, feffil Allum, dregs of the Oyl of Saffron, Myfi, Frankincence, of each two penny weight, they are powdered and mangled with astringent wine, or with Vinegar. But Sphragis polydye is thus. Take feffil Allum three penny weight, Frankincence four penny weight, Myrheas much, or eight penny weight, Violets two penny weight, flowers of tame Pomegranates twelve penny weight, Bulls gall fix penny weight. Atoes eight penny weight, make them up with sharp wine: But that which is made with fat Wooll is thus made. Take fat Wooll forty penny weight, lead powder, shales of Bitumen, of each ten penny weight, round feffil Allum, Pomegranate shells, Gallis, Myfi, Vitriol, Frankincence, of each five penny weight, Myrthe two penny weight, lees of Oyl eight Hemina. Those that are of riper years must be purged with sharper and hotter remedies, as with Diapica, and with Oyl mixt with wine, in great quantity, and other things infused, as salt pickle, the decoction of Centaurly, with Nitre and Honey, or Coloquintida, Chamalœon, Anchafa, Lupins; then Oyl of Cedar must be given in Clyyster, and after that rett; often repeating the same method of cure, also take salt flesh, sraping away the fat, and cut it long and round, and thruff that into the Anus, and binde it in, to hold it there so long as may be, and then lose it, and injecit again the forefaid things, and let us often repeat the same remedies.

CHAP. XXXIV.

Of Worms that breed without the Bowels, and chiefly of Maggots.

The living Worms that are bred in the head, the brain, the liver, milt, bladder, reins, muscles, proceed from the same caufe Worms in the guts doe, and are destroyed by the same remedies. But those Worms Hippocrates calls Eula, the English call Maggots or Gentils, they are Worms without feet, not unlike to Aracides, but that they are shorter a little, and thicker considering their length: There is no man almoeth that hath not seen the in Garrion and corrupt flesh, and sometimes in limbs that are dead by the negligence of Chirurgions, when they as apply a remedy that purteythes together with the wound or ulcer. Hippocrates calls Eula Worms bred in dead bodies. Sidus calls them it keates, filfe-eaters. Lucrarium calls them cruel Vermis, and Pinetory, Worms from corruption and putrefaction of the excrements boyling forth. Homer in his Ilis, 19 and 24, faith they are Worms arising from putrid matter, that are far smaller in the ears than in other ulcers: And Callus writes, that they are called Eula, which Latin writers call improperly Earmothes, since they agree with them neither in form nor figure nor in any mark whatsoever. Laitly, those small Worms that breed from Flies egges in flesh, in Summer, (the English call them Flieblowers, and the Germans Maggen) as Camenfits observed, are reekoning amongst Eula or Maggots. But those Eula or Maggots that breed in Hogs flesh or Bacon, have a proper name given them by Fætos and Perottus, who call them Tarni, Maggots. Have either a tayl, or they are without a tayl: Hens feed on both kindes of them, and fo it is likely other Birds doe. To make a woman conceive Hippocrates prescribes three or four parts of those that have tayls, bruised with Orangeum and Oyl of Roses, to be laid to the mouth of the matrix. In his first de morb. mulier, and in another place of the same book, he bids apply with Wooll the heads of these Worms mingled with the Secondine of a woman, and Allum of Egy, and goffe greale.

It is reported that Democrates of Athens, when he was a youth, and was sick of the Falling sickneffe, went to Delphos, and enquired of Apollo, what he would advise him to take against this troublesome disease, and that Apollo answered:

Take the greatest Maggot you can finde
In a Wilde Goats head, and cutty binte
That in a sheep-skin, &c.

Democrates
CHAP. 35. Of lesser living Creatures.

Democritus having heard the answer of Apollo, he repaired to Theognostus Democritus, who was then ninety years old, and he wondering at the providence of God, expounded this Oracle that was so doubtfull: Saith he, by nature the head of a wilde Goat is full of abundance of Worms, neer to the bias of the brain, and when he neeleth, many Worms fly forth at his nostrils; you must therefore lay a garment under the Goat, that these Worms may not touch the ground, but that you may catch them before, and so taking one or two of them, put it into a black Sheep-skin and bind it to your tender neck, and this faith he, is a natural remedy against this disease. These things are good against Licegetas bred in ulcers and wounds in man or beast. First cleanse the parts affected, with the gall of Frogs, the juice of Celandine, Sea water, or brackish water, with the decoction of Honey, Worm-wood, Horehound, Peach-leaves, Groundriel, juice of Betes, and Wine; then to kill the Worms, throw on Pepper, Salt Peter, or Allum in powde, Hellebore, Henbane, round Birthwort, Vitriol, or waft the fore-places with the juice of river Calamin, or the decocition of Centuary, or with the juice of Leeks or Horehound. Johannes Agricola prescribes Baglofs, but Pliny prefers Arifitoliachus with Honey; and Paracelsus commends juice of Celandine. Moutmann commends Nitre before all other things. Vegetus bids to waft the lores early in the morning with cold water, and to drench them thoroughly, for he affirms, that the Worms by this means will be so confracted with cold that they will soon fall down. Actius commends Poly, and Worm-wood mingled with Pitch, and he commends the anoynting of the parts with fatsing Spittle. Hildegerdus throws on the pith of Smallage, the thrill of a Tortoise, Bees that are dead in the Hive, the leaves and the bark of the Plum-tree, powdered and sprinkled on the ulcers. Bayrus applies quick lime tempered with the sharpest Vinegar. The places where the Worms are being sprinkled with the juice of Hippis, will be presently cured, faith Tardinus; but what this Hippis is, no man hath determined: Some think it is wilde Tanfey, some say 'tis Potentilla; Genesius understandeth it to be Chickweed, which by its sharp and Nitrous faculty (as the Betes have) kills all the Worms.

CHAP. XXXV.

Of Nits.

Nits in the Greek are called Doros and Cunidas, the Italians call them Lendine, the Spaniards The Name Lianede, the Germans Nits, the English Nit, the Mufcovites call them Guida. These are lit- and descrip- tive white living creatures, molt like to Syrones, if they had but feet, but they are twice almost as small; and their body is somewhat long, out of which Arifitola faith that nothing elfe can breed: Crackt between the nails they make a noise and die, they are not found only in the hair and eye-brows of men, but they abound also in the hair of Oxen and Cattle that are lean, and wanting feet, yet they will flick to folk sometimes, that you may easilie pull off the hair by their roots as pluck them off. Trought is not improperly calls them vergehumes, hair-eaters, for as Snails live on the juice of herbs, so these live on the myoyture of the hairs, and feed thereon. The PhilosopherTheir Original affirms, that they proceed from the corruption of Lece, and therefore are called their eggs. They nay, are like to the flowers of Jefmine that grows with us. For as Jefmine brings flowers without seed, so Lice bring forth egges without young ones in them. They die either for want of nourishment or Their End by using a Comb with close teeth, or by the use of such Medicaments as the old and new Physi- cians prescribe abundantly. Pliny mingleth Allum with Vinegar, or Vinegar with gall of a Calf, and also faith, they are killed with Goats milk. Also he commends Nitre mingled with Terra Se- mia and smeere on, and the powder of Harts-horn drank in wine. Abenazer prescribes, to annoy the hair with the leffer Centauria, and Akirum. Bmilton in Vinegar takes away Nits; as also Oyl mingled with Lie. Marcelus doth very much commend Hogs dung mingled with wine and juice of Roes; also to annoy with Honey and Sal Armeinick, but chiefly Oyl of Radifhes with a strong lie. Hildegardo provides a lie made of Datefrones, which being mingled with Oyl of Radifh roots, will kill the Nits. Ardonus mingles some sublimate of Quick-silver with Spirit of Wine: And he faith also, that if the head be first wet with a Hens egge, and then with the juice of Sow- bread, or Sea-water, that the Nits will never breed again. Gilbert an English man highly commends the gall of any Creature, as also all bitter things, cleaners, and Aromatical Drugs, with the juice of Marigolds.

CHAP. XXXVI.

Of Aurelia, and a Wood-worm called Teredo, without feet.

That which the Latins call Aurelia, the Greeks call Xyromallia, the name is borrowed from the gold- den colour which appears in most of them. It hath no mouth, nor yet any apparent parts, nor doth it void any excrements, nor yet ear, or move, unleffe it be moved by some body, or hurt. That which Pliny writes, that a Chryfallis hath a hard body, I think that is meant in respect of a Catter-
Catterpillar. But that which he adds that it will move if a Spider touch it, though I know this to be true by experience, yet I doubt he borrowed those words from the Philosopher, and interpreted them amiss. For the scene seems to be thus. They move if they be touched, and they are covered with paws like to Cobwebs. Aristotele speaks nothing here of a Spider pulling over them, as Pliny seems to translate it. Aristotele shuts the Aurelia not only out of the number of Insects, but also of living Creatures, and determines them to be but the Catterpillars egges. But what agreement is here with an egge? That is laid by another living Creature, and is void both of actual life and motion. The Aurelia is laid by none, but is changed from one to another, for it changeth its former shape into another shape, and retains both life and motion, not in possibility of being, but actually. But that doth not take away the life of it, because it neither eats, nor increaseth, for Dormice sleep all the Winter and eat nothing. The life of it doth resemble that sleep which is partly waking, wherein men are not properly awake, nor yet asleep; but are alive, and move a little. But I conjecture that the Philosopher wrote this, that he might confirm that Axione of his to credulous perversity, that all Insects either lay egges or little Worms. His words are these. Insects first breed Worms, but that which is called Chrystal, is an Egge, and afterwards from this it bred a living Creature, that at the third changing, both the end of its generation. Yet it is manifest enough by what I said before, that an Aurelia is no Egg, and it ought not to be called a generation, but a transmutation of a Catterpillar into this, and of this into a Butterflie. I say this for that purpose, that such as adore Aristotele for a God, may remember that he was but a man, and that he was subject to humane errors. There are two kinds of Aurelias that I have seen, some are downy, and others smooth, both are of divers colours, and sometimes they are Gold coloured, which are the true Chrystalides, and others that are but baird ones, are without any colour of Gold. They have their Original from the death of the Catterpillars, which as they do waile by degrees in certain days, so by degrees their covering grows continually more hid, and changeth into an Aurelia. These again the next Spring or Autumn, by degrees losing their life, a Butterflie comes forth of them that is bred by the like metamorphosis. What use they serve for, for the good of man kinde, I am wholly ignorant of. I know well enough how much they perplexed Aristoteles, writ by their wonderfull transmutation; and they set forth to us the boundless power of Almighty God.

George Agricola only propounds to us the Teredo without feet, which from the brazen colour of it, he call Kutter-worm: It creeps like a Serpent, faith he, because it wants wings and feet. It is as thin as a small Goose quill, and it is as long as a Scolependra: It is round, and breeds under rotten wood, and sometimes found hard by the Scolependra, or long Ear-wig. You may easily finde the figure of it placed amongst the Scolependra.

CHAP. XXXVII.

Of Water Insects without feet, and first of the Shrimp or Squilla.

Wee said before that all water Insects were with feet or without feet. Some of those that have feet, swim with six feet, as the Lobiler, the Shrimp, the lake Scorpion, the Evet, and the Sea-lowfe; others with four feet, some with more. We shall treat of them severally. The Squilla an Insect differs but little from the fifth Squilla, but that it hath the yards much shorter, and a more red colour, or rather a more earthly colour. Some of these are covered with a thin shell, and some again are smooth and naked. Those with shells live chiefly in small Brooks, and stick to the roots of Reeds or water-flags: They are of a yellowish colour, and sometimes of a white or Ash-colour. They go only with fix feet, the reit that are joyned to them, serve in stead of fins. The naked ones are either soft or hard. The soft ones are represented well enough by this figure, only suppopse their heads to be of a bright Bay colour, and their body died with a dark Ash-colour. All those that are covered with a hard crust are made with joynts, but some have round joynts, others other fashions. The form of the round joynted is exactly represented here, if you suppose him to be easily dyed with a lighter red. And such is the colour of the first and second
Of lesser living Creatures.

Chap. XXXVIII.

Of the Locust, Scorpion, Notonectum, the Grasshopper, the Wasp, the forked Claw, the Newt, the little Heart, and the Louse, all Water-Insects.

The Insect-Locust, is like the Lobster, for that cannot be called either flesh or fish: you see the figure of it: it is of a pale green colour: I have seen three kinds of Lake Scorpions, and I have them by me: the first is somewhat black, the other two are like to white sand.
be  
beater of Infers: cr, Book II.

...we call some Insects of the water Nonon 24, which do not swim upon their bellies as the rest do, but upon their backs, from whence it is probable that men learned the art of swimming upon their backs also. Some of these have eyes, shoulders, and bodies all black; some are green, some are fiery coloured, and some pitch coloured. For you shall seldom see two of them of the same colour; nature hath so variously adorned them. Water-Grathoppers hold the form described, but their eyes are extreme black, and their bodies are ash-coloured. The Wasp hath a brownish body all over, except the black eyes. The Forked Claw hath almost the same colour, but it is more full; it seems to want eyes, but it hath them hid within, whereby it both sees and perceives the object. The Lizard is of divers colours, and delighting in catching Fifti, it is common about the British shores, where it lyeth in wait to catch Fifti. The Corvus hath the just fashion of a heart, the feet and head being taken away; it hath very little black eyes, and fix legs of the same colour, & each with two claws. The Sea-Lowfe is an Insect that that is an enemy to all kinds of Whales, which by biting and tickling it puts into such a rage, that they are forced to run upon the sand, and hasten to dry land: I know nothing concerning the use of these creatures; but I seriously exhort posterity to search out the use of them.

Chap.
CHAP. XXXIX.

Of the Flea or Aellus, and the Scolopendra found in the Sea.

The Flea, or Sea-Aellus is like to a soft Squills, but it hath but four feet (as I may say by Geminus leave) and by often and long leaps it frees it self from having many feet. It is called Aellus from its leapings, Aristele calls it a Flea; from its bunch-back it is called a Sow: it is of a wan colour with blackness; the length of those that are in rivers is the breadth of one finger, and their breadth is not above half a finger broad. But the Sea-fleas are larger, which when the tye flows are seen also of times in fresh waters. It shews a wonderful deal of agility when men strive to catch it, or do but look upon it.

The Sea Scolopendra, sometimes is of a grey colour, and sometimes you shall fee others that are more red. These are longer and leaner, that is shorter and thicker. I saw both kindes in the year 1578. in coves of Oysters. For they are not found in the deep sea, as Geminus supposes, but in the muddy standing waters, where the Oysters are fatted, there they lye hid, Namemus warned Fisher-men concerning these, when he said:

See therefore that you let not irgende,
The fluid Jullis or deadly Scolopendras.

They are as Aristele writes lesser than the land Scolopendras, but not differing in their form. Namemus the Phythian makes of these a remedy to hinder hair from growing, or a depilatory, and highly commends it in his 34. Chapter. Take Frankincense, Vitriol, of each two ounces, sea Scolopenders three ounces, grind them all well, and mingle them with the powder of Quicklime, then pull out the hairs first, and anoint the places with that.

CHAP. XL.

Of Water Insects without feet, and first of Oripes.

No Philosopher that underlights as he should, will deny but that snow is water turned to fraut, by long subliming in the air. In this Worms are bred which the Greeks call xerox. Aristotile writeth something concerning these, which History I will briefly touch. In snow there are bred hairy Worms, very sluggish, and that more slowly, wherefore I reckon them amongst Worms without feet, so soon as they are taken out of the snow they die, as the Worms bred in the fire die, being taken from thence: with snow that is old and begins to look red, they become red also, but those that are found in new snow are white. It is, faith he, a certain thing that snow can no more corrupt them fire can. And indeed they cannot corrupt, yet in both of them are living Creatures bred, and they are nourished in both. I cannot in any wise content to Euhabodion the Scholast upon Homer, who affirms, that snow growes red from Minium, because those places are of a Cinnabrous quality, whence he conceives, that from the vapours rising from Cinnaber, the snow becomes red: I will not deny but that it is so in some places. But whether the Interpreter be pleased or not, we must needs grant that in some places the snow grows red, where no Cinnaber is. Strabo makes mention of such places in these words. In Charaenses and the Country of Cambicium, and in places near to the mountains of Caucasus, some little beasts are bred in the deep snow, which Apollonides calls echinos, and Theophanes names, that is, Mountain little hairy Worms, like unto the greater Terebrantia. I think their generation as admirable, as of the fire Worms; yet living Creatures are more easie bred in snow, than in fire, because in snow there is much air, earth and spirit, all which the fire consumes abundantly. And if the heat of the Sun happen to be with thefe, I shall use Salligers words, they make dung that smells the sweetest of all ordure. Also they are bred in abundance in Corinthia, as Joach. Vadiun reports. But Strabo in his Comment upon Pomp. Mel. adds a thing that is admirable, saying that these Worms are full of excellent water, which Travailers'
Travailers take, by breaking the bladder or coat it is in, and they drink this pressing it forth gently. For it is very wholesome and seasonable when the fountains are troubled, as it falls out often in great snows.

Chap. XLI.

Of Horfleeches.

Blood-fucker or Horfleech, in Latin Hirudo, in Greek Αβαθαν, in Hebrew Hulakab, in French Sanguin, in Italian Sangue, in Spanish Sanguisuelo, in High-Dutch Ein aegel so das blauzaugen, in English a Horfleech. These are water Worms that thirst exceedingly after the blood of living Creatures, and they will fill themselves with it sometimes till they burst and die. Some of them are without any passage through their belly, some are open behind; we give you the pictures of them here. Europe hath scarce any open behinde, but in America and India they are common. Thofe that are not open behinde, are obfervable to every man, and when they are filled with blood, their skin feems chequered with fibres. Some of them are of divers colours, some green, black, brown, yet not venomous, only the bright bay and Chefmuf colours, that are like to pills of trees. They breed chiefly in standing pools, where Cattel are wont to be watered, for from their feet earth and fowleffe are washed, and fall to the bottome, to fay nothing of the fefiment of their dung, out of which, that want not vital hear, living Creatures are bred. Once bred, they moft greedily thirst after blood, and therefore they lie in wait in the very entrance of the pools, that they may light upon Horfes, Oxen, Elephants, &c. fo soon as they come to drink for thirst of cold water. Pliny writes, that they are fo troublesome to the Elephant, that the beast is by their tickling and fucking in his fount, almost mad; which doth manifeftly fhew the wonderful power of Insects: For what is there greater then an Elephant? and what is there more contemptible than a Horfleech? Yet the grefneffe and wit of the Elephant must give way and yeeld to this Worm. They feed moft on blood of beafts, and watry bloody matter; yet when they want fuffeance, they fill themselves with the fift that rifeh from the water. Pliny faith they vanih in the Spring, l. 95. 51. but we fee that fepan to be moft fitt for the breeding of them. And indeed I can fee no reafon, that when they have overcome the Winters cold, they should not be able to fland out the Springs mildneffe. And this we all know, that Horfleeches will die in the Winter, unleffe they be carefully preferred in warm water, and fed with blood very plentifully. If any man fhawlew a Horfleech, fome periflade usto drink pickle, others inow water: But Aflephades bids us firft to waft the mouth, and to put aoit Sponge wet in cold water into the mouth, that the Horfleech fink-
Their use in physicke is manifold. For some (I tufe Galen words, lib. de different. : faginnae extubren-
di mult, Travét. 10, ) take Horfleches and put them up, and they ufe them diversly: For when
they are made tame they are easily put upon the skin; but thole that are taken mufi be kept
one day, and mufi be fed with a little blood; and so it will be that whatsoever venome they have
in them, they will soon caufe forth. But when we have need to ufe them, that part to which
you will apply your Leeches must be firft rubbed with Nitre, and mufi be appointed, and scratched
with your fingers, that by this means they may fallen the more greedily; but you mufi cast
them into warm water that is contained in a large and a clean vessel, then you mufi lay hold of
them with a Sponge, you mufi cleanse them with your hand from all filth and dirt, and so they
will be fit to be applied. And when you have fet them on, left that part they flick to should
grow cold, you mufi put on warm Oyl: But if they be to be applied to your hands or leet,
you mufi thrust them into the warm water that the Leeches are caufed into. And if they will not
hold fast, you mufi cut off their tails with a pair of Cifzers; for when the blood do runs forth
they will not leave off liquefying until you fprinkle falt or afhes upon their mouth: When they are
fallen off, that venemous quality they ufe to leave behind must be drawn forth with a Cupping
glaffe; and if that may not be done, you mufi ufe a Sponge to foment the place. And if yet
any bloody drops run forth, apply meal and Cummin, and then binde on fome Wool without
a little Oyl. But if yet the bloud will not flop, lay on a limmen clove wet in Vinegar, or burnt
glaffe, or a Sponge firft put into liquid pitch, and afterwards burnt. And this also you mufi ob-
serve, that Leeches draw that bloud that is next the fleth, and not that which is contained in the
Centre of the body. Menc ufe them commonly in lead of Cupping glaffes. Mark also that you
mufi take them off when they have drawn half the bloud. And you mufi beware that the bloud
run not forth fo long, until it be fufficient: For the part it felf will grow cold, both by rea-
on of the Leeches that are naturallly cold, and becaufe of the air that compaffe them about. So
far Galen. But Cardan bids us not to annoy the place with Nitre, but with milk, that they may
fatten the fooner; and withall to pinch the leech clofe, that thriving for revenge he may open
the vein, lib. 7. de rer. var. c. 28. What help they were to Dionifus the Tyrant of Heraclea,
we may read in Hilfories, who repreffenting rather a beaft than a man, for he died with a mighty
great pain, had been eaten by the Worms long before, unleffe Horfleches had been applied
to both his fides, and drawn forth daily fome quantity of the humours he was charged with.
It were too tedious to reckon up all the melancholique and mad people, that have been cured by
applying Leeches to the Hemorrhoids in their fundament. Yet I may not over-paffe the Noble
Richard Cavendifh, (the moft learned Unkle by the fathers fide of that famous Navigator through
the world Thomas Cavendifh) who was perfitely cured of his Gout that had held him many years,
only by applying Horfleches to the Emrods in Any every moneth, fo that now to the great
wonder of all the Court, he walks alone without any help, and being found and void of all pain,
be lives an old man. Alfo Horfleches fet upon the fundiment, will fo wonderfuly pluck back
the humours that run from the whole body to the joynts, that they will prefently eafe the pains
like a Charm. This I proved at Limn upon an excellent Mulitain, one Raffum; who for the
great pains he endured, and by continual waking, fell into a burning Fever, with raving, in the
Dog-dayes, at which time Hippocrates faith it is dangerous to purge. It is in this cafe fuch a re-
medy, that it is to be preferrd before all others, for they draw from the whole body without
any trouble or losse of a mans forces. J. A. Aubert. Exercit. 50. progymn. Fernel. Adul. God-
frid au Caenem, a Venetian, a famous man, and my very great friend, for just and lawfull caufes,
who told me that he saw one who had the joynt Gowe, who lived many years free of all his
pains, only by applying Leeches to the part that was in pain. Med. de Grad. and Sannazola. Ja-
cob Durmet, Apolog, lib. c. 3. perfwade the fame remedy. Alfo Gibertus Anglicus reportes, that the
Lowtie difeafe generally is to be cured with the afhes of Horfleches boyled with Scorax: For
they are not only ufefull for men whileft they are alive, but when they are dead and burnt to
afhes. Pliny reports, lib. 32. c. 7. that Horfleches will black ones hair, if they be corrupted in
black wine for fifty dayes: Others bid us take one fextarius of Leeches, and let them lie to cor-
rupt in two fextarii of Vinegar, in a leaden veffel for fo many dayes, and then to anoynt with
them in the Sun. Sannazola relates, that this medicament is of fo great force, that ufeffe they
hold Oyl in their mouths that die the hair, it will also black their teeth. Meger writes, that live
Frogs purrified in Vinegar, will take off the hair, but the afhes of Leeches anoynted with Vi-
negar will doe the fame.
Chap. XLII.

Of Water-worms.

In waters both salt and fresh, great and small Worms will breed of putrefaction, especially in Summer, very like Earth-worms, but they want that knot or chain about their necks: Also they are by far more sharp and lean; oft-times they lie in the sand, and they cast up earth out of their holes, as Earth-worms do: In sweet waters, that are standing, and not deep, there is found a kind of Worms of a full red, that resemble in shape the Teredo without feet, but that they have greater heads. Their tail is forked, whereby they slay themselves, till lifting up their heads they may finde a place to fasten the rest of their body, and so they creep upon the mud and stones, and so they move in a brandishing manner crookedly. In Summer, when it is clear weather and hot, they come forth together in great numbers, but if the mud move never so little they presently withdraw themselves. The English call them Summer-worms, either because they are seen only in Summer, or they die in Winter. In the Mediterranean Sea there is a round Worm found as great as a great Snake, and of the same colour, but it hath neither head nor tail, as Wickerus observeth. Sometimes it is twenty foot long. What may be the use or nature of these I have not yet observed. But I hope that others will discover that light that shal shew us both. Yet this is certain, that those Worms serve for baits to catch Fish, especially those small red ones, and Fisher-men diligently seek after them for that purpose. We call them Water-worms, because as Earth-worms will not live long in water, so Water-worms put upon dry land soon die, they wanting Air, and these for want of water.

The Contents of the Chapters.

Chap. 15. Of the generation, population, and use of Spiders. 1072
Chap. 16. A commendation of Ants, wherein is described their differences, nature, cunning and use. 1074
Chap. 17. Of the Cicindela, and female Melus, and of the Hornet and field Cheret. 1080
Chap. 18. Of mineral worms with fix feet. 1081
Chap. 19. Of Worms in vegetables with fix feet, and first of Worms in Trees. 1082
Chap. 20. Of Worms in fruits, corn, vines, herbs. 1085
Chap. 21. Of the use of Worms in Minerals, and Vegetables, and the way to destroy them. 1088
Chap. 22. Of Worms in living creatures that have fix feet, and first of Lice in men. 1090
Chap. 23. Of Lice in Brutes and Plants. 1094
Chap. 24. Of Hand-worms and Mites, and worm in living creatures. 1094
Chap. 25. Of Wighlee. 1096
Chap. 26. Of Sheep, Tikas, and the like. 1098
Chap. 27. Of the Moth that devours clothes. 1100
Chap. 28. Of the flea. 1101
Chap. 29. Of the Infests wanting feet, and first of the Intestines of the earth. 1103
Chap. 30. Of Worms in living creatures. 1106
Chap. 31. Of the description of Worms in the Intestines. 1108
Chap. 32. Of the original of Worms in the Intestines. 1110
Chap. 33. Of the signatures and cure of Worms out of Gabusism. 1111
Chap. 34. Of Worms bred without the Intestines, and first of Euloi, Gentilis or Maggots. 1122
Chap. 35. Of Nits. 1123
Chap. 36. Of Aurelia and Teredo without feet. ibid.
Chap. 37. Of water Infests without feet, and first of Squilla or Shrimp. 1124
Chap. 38. Of the Locust, Scorpion, Effet, Grassopper, Hornet, Forked claw, Lizard, Coraliwm and Lomfe, all water Infests. 1125
Chap. 39. Of the Flea or Sow, and Scolependra of the sea. 1127
Chap. 40. Of water Infests without feet, and first Oripes. ibid.
Chap. 41. Of the Horseleech. 1128
Chap. 42. Of Water Worms. 1130

THE END.
